Space does not permit of a general review of the great mass of testimony presented by both sides. The main basis of the trainmen's contention was that their responsibility and work had increased in the past few years and that the pay of Western trainmen was higher than theirs and that they were entitled to an equal amount. The testimony did not develop, however, so far as we are able to determine, that there had been any increase in work or responsibility since 1910, the year in which this class of employes had their salaries increased. As a matter of fact, the testimony of railroad officials clearly indicated that recent improvements had tended in many instances, rather to decrease, if not the responsibility, the actual labor and risk involved. It was also pointed out that trainmen at the present time were receiving an unusually large wage as compared with those employed in what might be termed similar capacity in other industries. The arguments made by the employes that railroading was a dangerous calling and that thousands of employes were killed every year, was largely discounted by the development of the fact that these casualties were due in a very large measure, to the men constantly taking chances, many of which were forbidden by the rules of the companies. The contention that traffic

E. R. HEWITT.
Assistant trainmaster of the Bessemer and Lake Erie, who testified that modern improvements and equipment had reduced hardships and the employes' responsibility.

growth in itself was responsible for more accidents, was not proven, as the increased safeguards which are constantly being thrown around the employe would more than offset such contention were the men ordinarily careful in the performance of their duties.

F. J. Warne, a statistician employed by the trainmen to prepare figures to support their contention of a necessity for wage increase, got way off the track by attempting to prove that sixteen men practically dominated the entire Eastern situation by means of interlocking directorates. He failed, however, to prove this interesting statement to be true and at best it had only a very indirect bearing on the controversy.

During the presentation of the trainmen's side of the controversy, William G. Lee, representing the trainmen, said that in 1910 a rate increase was negotiated with the Baltimore and Ohio, which was made the standard demand of the trainmen on all railroads in the Eastern territory. These rates are now in operation. Mr. Low asked:

"I do not understand why you should be endeavoring to gain a higher standard of pay when the standard you asked for in 1910, the Chicago standard, was granted at that time. I see no need of eliciting testimony and citing conditions during the years prior to 1910, if you got what you requested in 1910 on the basis of working and salary conditions then existing."

"We have never got what we asked for," said Lee. "Every settlement ever made with a railroad has been a compromise. The increases in 1910 were from 5 per cent to 15 per cent below our requests."

Mr. Lee in all frankness might have added that within recent years railway employes have entered these controversies with a practical understanding that if successful the award would be in the nature of a compromise. The question confronting the Board to-day is not whether the trainmen received all they demanded in 1910, but whether they are entitled to any increase at the present time on the basis of greater service or the ability of the carriers to pay higher wages.

Some of the reasons given for the necessity of the advance bordered on the absurd, such, for example, as that of a freight conductor of the Baltimore and Ohio who claimed substantially that a railroad man out of a job at the age of thirty-eight, found it next to impossible to get work elsewhere and was evidently, therefore entitled to the added protection of more pay. Why he should find himself out of work or why his condition differed from any other man finding himself out of work under similar conditions, was not enlarged upon.

In speaking of the contention of the trainmen that hardships are increasing in modern railway operation, E. R. Hewitt, assistant trainmaster in the employ of the Bessemer and Lake Erie, stated, in his opinion, that modern railroad improvements had greatly reduced hardships and modern equipment had greatly reduced the employe's responsibility. He made extended references to the work of various trainmen on his road to prove his contention.

The railroads presented a strong case against further increases at the present time. It was conclusively shown that operating costs had already reached a point where financial problems were becoming a matter of great embarrassment and that certainly no changes either in responsibility or quantity of work had occurred to justify an increase in wages since the recent one given to the trainmen generally. It was shown that the roads had within recent years, been more liberal than conditions justified, and that many wage increases had been artificial and forced upon the carriers by conditions over which they had little control.

It was clearly shown that the wages of railway labor were unusually high as compared with wages paid in other

Digitized by Google

industries and that a further increase in salaries at the present time would be unfair and result rather in a decrease than an increase in efficiency. As to a comparison between the wages paid in the East and West, the evidence was of a very general character and failed to prove in a conclusive way the employes' contention. Mr. Low declared that the basis of the demands of the Eastern trainmen and conductors as he viewed it, was that they should be paid the same high rate of wages as those paid in Western territory for similar services and for practically similar conditions, but that, notwithstanding this fact, neither side had during the entire arbitration proceedings thus far made it clear whether this contention was based on the varying conditions of labor or comparatively greater responsibility on Eastern roads or attacked by the carriers on the ground that the intrinsic value of the employes' services were not as high as they are in Western territory.

Overtime work has apparently become one of the important factors in the controversy. The trainmen are demanding for overtime work, the pay per hour that they receive for regular working hours with one half of the hourly pay added. They endeavored to make it plain that they wish to penalize the railroads for making the men work long hours. On the other hand, the railroads insist that the trainmen want extra pay for overtime so they may increase their earnings by delaying their work until overtime occurs.

Comparing the Eastern and the Western situation, Mr. J. G. Walber, assistant to the third vice-president of the Baltimore and Ohio declared that on account of better working conditions the trainmen in the East preferred Eastern work and were really better compensated for their work than elsewhere.

As a glaring instance of the intolerant attitude taken by railway labor, a statement made by A. B. Garretson at the hearing on the morning of October 2d, is of interest. Mr. Garretson virtually asserted that the demands of the men had no relation to the earnings of the railroad and that the men were not necessarily interested in the question as to whether the roads were paying enterprises or not, save the respect of their ability to pay the wages demanded. Mr. Walber in the course of his testimony produced tables to show the arbitrators that the requests of the conductors alone in all classes of service involved an increase in wages of 21 per cent, or $6,421,657 more per annum based on costs of operation of the 42 roads in October, 1912. The freight flagmen's demands, he said, amounted to an increase of 28.2 per cent, or $3,795,215 more per annum; the passenger flagmen or rear brakemen were asking an increase of 25.9 per cent, amounting to $935,164 more per year and the regular brakemen, exclusive of extra men required in this class of labor under the various "full crew" laws, would receive an increase of 17.5 per cent, amounting to $6,283,844 more per year than they were now receiving.

The demands of the conductors and the trainmen for extra pay for overtime, Mr. Walber told the Board, would mean an additional $6,267,475, or 75 per cent, to financial obligations of the carriers every year, the monthly passenger minimum of $135, instead of $125, would add $263,675; local freight guarantee, $128,660. The net results of granting the changes in mileage and overtime rates asked by the conductors and trainmen would add $14,685,200 to the annual costs, witness stated, and the concessions in changes in rules as requested would mean an additional $3,290,487 per annum of itself.

Another noteworthy development in the hearing was the admission made by W. G. Lee that the rank and file of railroad employes throughout the United States were imbued with an insatiable desire to secure continued increases in wages which it is difficult if not impossible to stem.

The leader of the trainmen told the arbitrators that the employes in Western railroad territory, despite the increases granted within the past four years, have recently been clamoring for another wage movement and he expected that at a convention of the Western trainmen, to be held at Chicago on October 28 next, these new wage demands will afford the chief subject of discussion. Mr. Lee said that both he and Mr. Garretson would go to the Chicago convention with the hope of acting as a safety valve if they succeeded in closing up the pending proceedings in time.

Mr. Lee further declared that the firemen and engineers in Western territory are also now engaged in a movement for higher wages. "We do not know where the wage demands will stop, and we do not know of any way by which all the men will be satisfied, but I doubt if we ever can stop the men in their demands for more money," he concluded.

Digitized by Google

Mr. Low at a meeting of the Board of October 9th said that in order to expedite business for the Arbitration Board he would make a statement which he thought might be useful. He said: "As I understand it the two large questions before the Board are:

"First. The men claim that they should receive the rate of pay ruling in the West without regard to any difference in conditions now existing. The railroads admit that the rates of pay are higher in the West, but they claim that the difference in conditions justifies the difference in rates.

"Second. The readjustment of pay for conductors and trainmen was made as recently as 1910. The men claim that notwithstanding the advance in the rate then made, the present demand for an increase of rate is justified. The railroads claim that nothing has occurred since 1910 to justify any further advances.

"Before either side closes its case, I hope that the men will develop, as fully as possible, why they think—if they do—that differences in condition between East and West either do not exist, or, if such conditions do exist, why they do not justify the differences in rate. And also what in their judgment has taken place since 1910 to justify a further increase in rate. And that the railroads will develop, as fully as possible, what are the differences of condition between the East and the West which make it reasonable to have lower rates in the East than in the West. And also why they believe nothing has transpired since 1910 to justify an increase of rate."

In their final brief, the Conference Committee of Railroad Managers, contended that the Board of Arbitration should not only refuse all of the demands of the men in the light of evidence, but should hand down an award creating a lower basic rate to passenger men on all through trains making few stops.

"We believe that we have shown by the statistics presented, the evidence produced and the arguments made," the managers declare, "that the conductors and trainmen are not entitled to any increase whatever at this time. In fact, the brakemen in both passenger and freight service affected by full crew laws, as well as yard brakemen, are now too liberally paid, and in the judgment of the railroads the basic rates for the services mentioned should, in all fairness, be reduced."

Elisha Lee, chairman of the conference committee of railroad managers, in the final brief for the carriers made a vigorous attack on the evidence submitted by the trainmen during the hearing. He declared that the burden of proof was upon the employes, and they had failed absolutely to prove that the present wages were not sufficiently compensatory for the services rendered, nor had the men shown that working conditions were unreasonable.

"We desire to call attention of this board to the fact that on the face of the evidence the strongest plea for an increase in rates appears to lie in a comparison of the basic rates in the East with those in the West," Mr. Lee continued. "We hold that it has not been proved that the Western rates are proper as applicable even to Western conditions, nor that Eastern conditions are such as to justify the adoption of Western rates even if they had been proved just in the West.

"Furthermore, it has been shown that, notwithstanding the higher basic rates in the West, the average cost to the railroads for conductors and trainmen's wages per train mile in the East is greater than in the West. In addition, it should be borne in mind that the close proximity of terminals in the East is such that the railroads are often unable to obtain a return in train miles equal to the wages paid, and for this reason the conductors and trainmen occupy an advantageous position in the Eastern territory not enjoyed by the men in the Western territory, by reason of the large amount of constructive mileage which they are paid.

"If the public, through this board, conclude, after learning all about the rates of pay these men receive, that they are already getting as much or more than any other railroad and industrial employes, then there is but one consistent course to pursue, and that is to deny the demands in toto."

In conclusion, the managers submit a list of twelve items which they ask that the arbitrators use as a basis for their award. In each of these they request that the specific demands from the trainmen for new basis of pay, such as monthly guarantees to passenger men, reclassification of services, time and a half for overtime, extra or double pay for doubleheader trains, etc., are not justified, and should, on the basis of the evidence submitted be denied.

FILING THE ADVANCED RATES

The railroads in the Eastern territory have about completed their enormous task of reconstructing their freight tariffs on the basis of a five per cent increase, and at the present writing it is hoped that practically all such advances will be on file with the Commission by the 15th of October. The task has

Digitized by Google

been an unusually severe one, keeping traffic men and their assistants working overtime for many months, but it is the belief of the Eastern executives on account of the minority opinion of the Commission expressed at the time the advance in rates was first petitioned in the spring, that it would be better to put a definite proposition before that body in the form of tariffs showing the increases desired.

Reports from Washington indicate that the irrepressible Louis D. Brandeis of Boston has been retained by the Commission to represent the opponents of the five per cent increase. However, by the way shippers and business organizations are endorsing the movement, Mr. Brandeis, by the time the argument is on, may have acquired the distinction of standing largely alone in this capacity. As a preliminary move the tariffs will, of course, be suspended and a hearing on the general subject inaugurated. It is at this hearing that Mr. Brandeis is expected to shine, but we hardly believe he will again be able to force upon the public such bunkum as his greater efficiency plans which he sprung upon the last hearing of a similar character and by which he declared the railroads could save a million dollars a day. In an authorized public statement Commissioner Harlan gives the following reason for the retention of Mr. Brandeis:

"At the request of the Commission, I have been in communication with Louis D. Brandeis, of Boston, and he had consented to act as counsel in the rate advance case. This is in accordance with what has been the practice of the Commission for some years in cases of large importance and of wide general public interest. It must not be supposed, however, that the Commission has retained Mr. Brandeis to advance or support any special theory or preconceived notion of the Commission about the case.

"The carriers who have asked the rate advance will be represented at the hearing by some of the ablest attorneys in the country; they will fully develop the concrete proposition that the carriers are in need of more revenue. The individual shipper is ill-equipped to meet such a controversy because his interest is confined largely to the rates on his particular products; therefore, until the Commission takes steps to develop the other side of the broad question, it is likely to have a one-sided record upon which to dispose of the issue.

"In a case of such importance, we feel that we ought to have all the light possible. Manifestly, in such a case nothing short of a full record will give the Commission a satisfactory basis for whatever conclusions may be reached. It is with this thought in mind that Mr. Brandeis has been asked to aid the Commission in bringing out all the facts.

"His selection for this duty has no other significance, except as it may be regarded as a recognition by the Commission of his standing as a lawyer and of his well-understood ability in analyzing and broadly treating questions of large importance and public interest. Doubtless, certain protestants will have their own attorneys, but Mr. Brandeis will be the general channel through whom the views of the opposition to the proposed advance may be presented of record."

There can be no question but that the railroads stand a far better chance of success in procuring a favorable action by the Commission than they did at the previous hearing. Business to-day more generally recognizes the fact that without railroad prosperity, general business prosperity is impossible. They not only more fully appreciate the dangerously narrow margin between costs and revenues under which the railroads are now operating, but they are beginning to understand that unless this margin is permitted to expand, increased facilities to care for growing commercial demands cannot be provided, nor can a thoroughly efficient plant be maintained.

This can be readily understood when it is appreciated that railroad rates have been practically the only artificial exception to the general rise of prices which has been going on for a number of years. The railways, being large purchasers of supplies and among the greatest employers of labor, have felt these increases all along the line, and while straining every effort to offset them by a greater efficiency and therefore relatively smaller expenditure for operation, they have found themselves unable to stem the tide and have now reached a point where some of them actually face a forced deterioration of their property, unless greater revenues are provided for. Furthermore, it is becoming increasingly embarrassing to finance their fiscal obligations and the future of a number of roads is fraught with grave uncertainty.

There are two factors which would help these roads to recover lost ground and these factors are necessarily correlative, namely, higher rates and a continuation of general prosperity and free tonnage movements. The former is likely to bring about or continue the latter and therein lies the responsibility of the Commission, the influence of whose decision is likely to reach far beyond the welfare of the railways.

In discussing this general subject in its October issue, the *Engineering Magazine* has in part the following to say:

Two grounds have been taken by opponents of the advance of rates. One, adopted by the Inter-

Digitized by Google

state Commerce Commission three years ago, was that figures of cost and revenue did not indicate the need of the increase. The other, urged by counsel for the shippers but not passed upon by the Commission, was that practicable correction of wastes in operation, practicable betterments in efficiency, would provide more than any alleged necessary enlargement of revenue; and that until this attainable efficiency was reached by the roads, no advance in rates should be permitted. The railways should not be allowed to recoup themselves from the public for the loss due to their own inefficient methods of conducting transportation.

As to the first of these considerations, a composite impression from current events is certainly that conditions have changed very much in the last three years, and that the margin of revenue must be less now than it was then.

As to the second argument, probably three years progress in the definition of the principles of efficiency, and in patient effort to convert the industrial world to their acceptance and practice, will convince even the most earnest apostle that men and institutions must grow more efficient as man grows more moral—by slow evolution, moving in cycles not of months—scarcely even of years—but rather of generations. Efficiency gains ground by individual conversion and spreads from the convert to his fellows. Railway men are probably no less ready than others to accept the propaganda and earn the promise held out so surely to those who achieve efficiency; but railways as a whole can no more be lifted suddenly to a plane higher than that occupied by industry at large, than carpenters as a class could be made intellectually and morally perfect while stone masons or pipe fitters remained distinctly human.

Much, therefore, as we may deplore a rising scale of prices because of the perplexities it brings us, much as we may disapprove anything resembling inflation, we seem to be confronted with conditions too fundamental to be settled by any power of regulation that can be exercised by a single commission. If, whatever its causes, the rise of money-equivalents for units of substance and service is a world-wide phenomenon, nothing but unfortunate and probably disastrous economic disturbance can come from artificially "pegging" one part of the circle when the whole circumference is irresistibly expanding.

No cause—least of all the cause of efficiency—can be advanced by denying to railways a standard of compensation for service commensurate with standards of compensation received by individuals and corporations elsewhere.

On October 15th, Daniel Willard, president of the Baltimore and Ohio Railroad and chairman of the Committee of Railroad Presidents, chosen by the Eastern railroads to present their petition to the Interstate Commerce Commission for an increase of freight rates, issued the following statement:

"The railroads, in the territory east of the Mississippi and north of the Ohio and Potomac rivers, to-day filed with the Interstate Commerce Commission revised tariffs covering freight rates in official classification territory involving an increase of approximately five per cent. The tariffs as filed are to take effect on November 15th.

"It is expected that the Interstate Commerce Commission will institute an inquiry and hearing with regard to these tariffs in the near future, when the railroads will present in detail to the Commission the reasons which made it necessary, in their opinion, to request the increase in rates.

"The gross earnings have shown a considerable increase since the last hearing in 1910, due to increased business handled. This increased business could not have been moved except for the additional tracks, terminal facilities and equipment provided. This has been done through the expenditures of large amounts of additional capital, which has greatly added to the charges the railroads must pay. This, and the greatly increased rates of pay, as well as the increase in other expenses and taxes, has seriously reduced the return on capital invested and so lessened the margin on capital as to render it difficult to see how investors can be induced to provide the capital that will be needed to keep the transportation facilities up with the requirements.

"It is a matter of public record that in no country in the world do the people make use of so much transportation per capita as in the United States, due, of course, to the great area of the country and to the fact that our domestic economy has been built up upon the theory that each part of the country should be made to raise the crop and develop the product most in keeping with its natural resources and then depend upon the transportation facilities offered to move the crops, the coal and the ore from the place where each can be most economically produced to the place where required by the ultimate consumer. Such an economic policy of course, makes it absolutely vital that transportation facilities should keep fully abreast with the productive capacity.

"Railroad rates have been practically stationary in the United States for a considerable period of time. The proposed increase is very moderate and will bear but lightly on any particular unit of traffic. If the railroads are to have the necessary funds with which to provide the transportation facilities absolutely required for the proper development of this country, this increase in rates is necessary, and as the commercial health of the United States is so inextricably interwoven with the soundness of its transportation system, it is hoped that this increase in rates will receive the support of that public whom it is the duty of the railroads to serve."

PROGRESSIVE POLICY FOR THE NEW HAVEN

Under the wise and vigorous policy of President Elliott and his Board of Directors, the New Haven has recently been making rapid progress towards eliminating those methods and conditions which have within the past year or two aroused so much criticism and public opposition. A notable development has been the election of President Hadley, of Yale University, to the Board of Directors. President Hadley is not only the head

Digitized by Google

of a great New England university with a special interest in the New Haven by reason of its location, but he is a world-wide authority on railroad transportation, and his election to the board greatly strengthens that body and is an added assurance to the people of New England that every effort is being made to conduct the affairs of the company in a way which will meet with their approval.

In addition to the election of President Hadley, the Board of Directors have also accepted the resignations of Theodore N. Vail and Alexander Cochrane. These resignations are taken as an indication that one of the first steps which the Elliott regime will take in bringing about reforms desirable to the Federal authorities, is that of splitting up the old system of close and interlocking directorates with the Boston and Maine. Both Messrs. Vail and Cochrane are directors of the Boston and Maine and their resignation from the New Haven board is considered a step in the general plan of reorganization as acceptable to the Federal authorities. On October 22d, Mr. Elliott was elected chairman of the Board of Directors and James H. Hustis, president of the system.

For the purpose of complying as rapidly as possible with the recommendations of the Interstate Commerce Commission, the Board of Directors have provided for six special committees to investigate every condition mentioned in the Commission's report of June 20th. President Elliott issued the reply of the directors to the Commission, telling what steps had been taken so far towards complying with their directions. These include the separation of the Boston and Maine from that of the New Haven and the provisions for a separate official staff for the Ontario and Western. Action along similar lines will be taken as rapidly as possible with regard to the trolley and steamer lines, but the directors feel that the New Haven and Boston and Maine matters should receive first attention. President Elliott further asserts that all the changes recommended by the Commission are to be taken up as soon as the board can accomplish it.

The six committees named to carry into effect the Interstate Commerce Commission's recommendations are: One to investigate the Connecticut trolley situation, one to consider the Rhode Island trolley situation, a third to investigate the steamship situation, a fourth to investigate the relations of the New Haven and Boston and Maine, the fifth to consider the trolley situation in western Massachusetts and the sixth to consider the relations of the New Haven with its other subsidiary railroads.

PRESIDENT HADLEY,

of Yale University, who has been elected to the Board of Directors of the New Haven System.

After the meeting President Elliott made public a letter he had sent to Governor Foss, of Massachusetts in reply to the Governor's request that the road permit an inspection of its books, in view of the agitation over the New Haven's "general expenses" account.

Mr. Elliott said he would be glad to comply with the request for examination of the company's books, vouchers, etc., as soon as the Governor or the Massachusetts Public Service Commission desired.

A few days after replying to the Interstate Commerce Commission, President Elliott and his associates, T. Dewitt Cuyler and President Hadley, of Yale, journeyed to Washington for the purpose of conferring with the Attorney General on the general situation in New England. After a two-hour session, President Elliott, just before leaving, issued the following statement:

"We discussed the whole New England railroad situation with the Attorney General and Mr. Gregory. We took up on broad lines and considered the suggestions and recommendations of the Interstate Commerce Commission as made by Mr. Prouty. We explained the plan of the New England board to investigate with great care the steamship ownership, trolley ownership, Boston and Albany lease and Boston and Maine holdings.

Digitized by Google

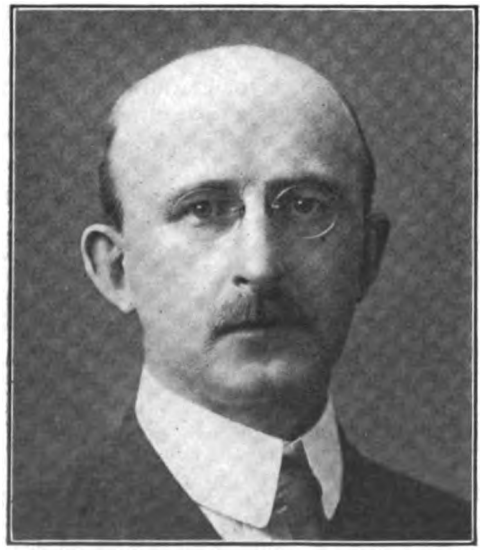
"The discussion was very full and frank on both sides and the New Haven directors will hurry their reports and recommendations as fast as they can and confer with the Department of Justice and Interstate Commerce Commission from time to time.

"No definite conclusions were reached and no commitments were made by either side, but it is thought that the conference will prove to have been helpful to the government and to the railroad in trying to bring about a solution of a difficult situation, with the least possible disturbance to New England and to the owners of the property."

Attorney General McReynolds did not add much to the statement made by President Elliott. He said that the latter and his associates did not offer any specific plan that would satisfy the Department of Justice or prevent a suit, but that the discussion was along general lines as to conditions and might lead to something more definite.

The Attorney General moreover declared that the New Haven directors were disposed to improve the situation and comply with the law, and, as he has done in discussing the matter before, indicated that he was willing to hear what they had to say. No arrangement has been made for any future conference.

In view of this interview with the Attorney General, the chairmen of the various committees of the directors who will conduct the investigation have been urged by the Executive Committee to make as much haste in bringing in their reports as possible. The final date set for all the reports with recommendations for reforms which it is hoped will meet with the approval of the Attorney General and thus avoid the filing of a dissolution suit by the Government, is December 1, but President Elliott later announced that the reports might be expected before that time.



FREDERICK J. MACLEOD.

Chairman of the Massachusetts Public Service Commission which have approved a $67,000,000 bond issue for the New Haven.

After a most thorough and searching investigation, the Public Service Commission of Massachusetts has approved the bond issue of $67,552,000. Stockholders have been notified that 65 per cent of the subscriptions must be paid on November 15th, and 35 per cent on January 15th, 1914. President Elliott declared that the approval by the Commission was highly gratifying to the management at this time. During the course of the hearings President Elliott gave the following reasons for the necessity of the issue:

"The large expenditures for steel equipment and for signals, to say nothing of the many other improvements, like stronger bridges for carrying the heavier engines that are needed to haul the steel cars, and of the innumerable additions and betterments that are needed all the time upon the various parts of the road, mean the furnishing of great sums of money.

"The company is now asking permission from the public authorities to issue certain debenture bonds for the purpose of financing itself and it hopes to obtain that permission and in that way receive $67,552,000 which will be used to pay off notes on bonds falling due within the next few months of $46,023,750, leaving the balance of $21,528,250 for the class of expenditures mentioned.

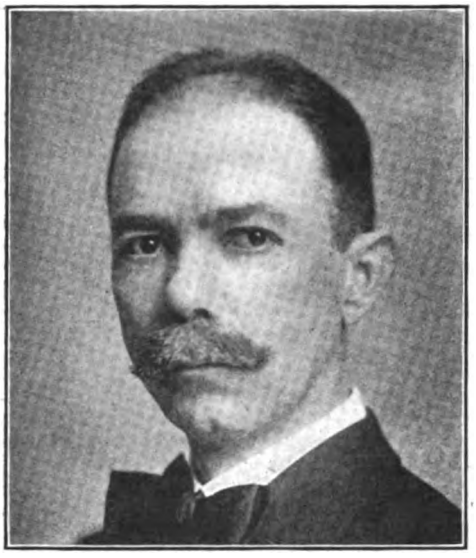
"If it cannot get the money it cannot do the necessary improvement work so that it would appear to be to the interest of the public as much as to the interest of the railroad to have the proposed plan go through promptly, even if some disagree on the question of what is the best way to raise the money.

"That is a question of judgment and the directors in making up their plan did what they thought was safest and wisest at the time in trying to protect the present and future of the property."

The report of the Interstate Commerce Commission on the North Haven wreck which occurred on September 2d, and which is more fully discussed in another section of this issue, severely criticises the management of the road as well as the men more directly involved, although, of course, it exonerates the new head of the system. The Commission's opinion may be summed up in the expression of "man failure" all along the line.

President Elliott has attacked this problem in his usually vigorous manner, one of the immediate results being a change in the rules governing the employment and pro-

Digitized by Google



INTERSTATE COMMERCE COMMISSIONER MCCHORD. who prepared the Commission's report on the North Haven wreck.

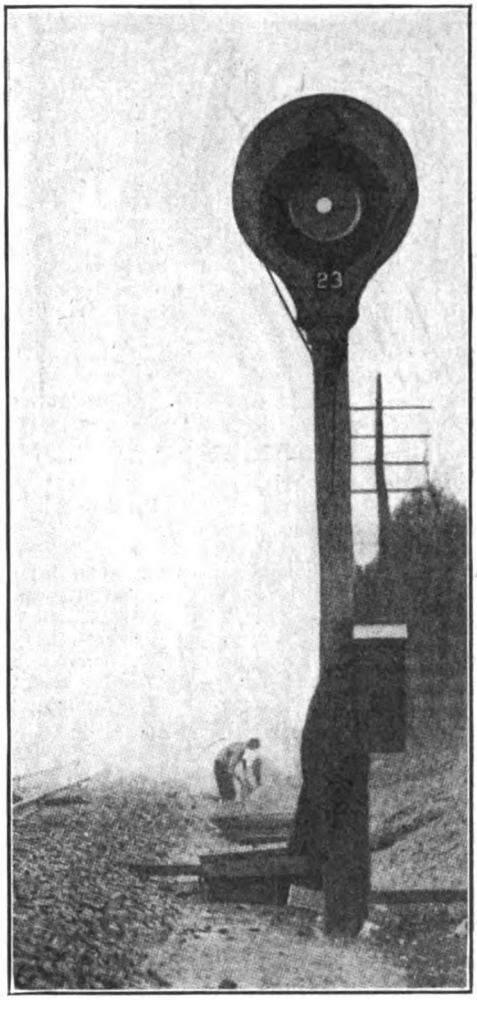
motion of engineers and firemen. These changes in rules have led to a certain amount of friction between the employes involved and the company, and threats of a strike have been freely made. The company feels, however, that it has both the National and State Governments as well as the general public behind it in its effort to promote more effective discipline in the operation of its trains, and it is not likely to give way. Governor Foss, of Massachusetts, has gone so far as to warn the railway labor of Massachusetts that should they strike on account of this effort on the part of the New Haven to procure greater discipline and safety, he would call a special session of the Legislature for the purpose of having them authorize such means as will protect the interests of the people and to pass a law that shall prohibit railroad strikes in that commonwealth. While the attitude of the Governor has been bitterly assailed by railway labor, it undoubtedly has had its moral effect and it is hardly to be expected that a strike will be ordered under existing conditions, as railway labor must appreciate that such action would at once alienate the sympathy of the public.

Regarding the general policy of the New Haven towards the public, this is interestingly set forth in a letter written by President Elliott to Governor Foss, in reply to several questions asked regarding the present attitude of the New Haven towards what Governor Foss termed "underground" methods. Mr. Elliott said in part:

"I believe that the people of Massachusetts and New England will find that it is the earnest desire of the directors and all of the officers to manage the railroad in a frank and straightforward manner and to attend strictly to the transportation business. On no other basis would I have been willing to come here and assume my present responsibilities, and this is so understood by the directors of this company, who are heartily in accord with this policy.

"I concur heartily with you that there should be the closest co-operation between the officers of the road and the public authorities, and that there should be open and above-board work in the discussions about any legislation, for or against the interests of the railroad company, between the representatives of the railroad and the members of the Legislature and the various governmental officers."

In spite of his recent strenuous activities, President Elliott found time on September 30th to deliver an address before the Bos-



THE BANJO SIGNAL OF THE NEW HAVEN WHICH IS TO BE RAPIDLY REPLACED BY THOSE OF THE SEMAPHORE TYPE.

Digitized by Google

ton Chamber of Commerce on the general railway situation, with particular reference to the requirements of the New Haven. In his opinion a short route to the restoration of public confidence in the railroads of the country would be furnished by a positive declaration by Federal and State commissions that rates may be advanced. Several times throughout his speech Mr. Elliott touched upon the possibility of an advance in rates. He said in part:

"To have a safe, adequate and smooth running transportation machine in New England is just as important to her future growth as to have adequate banking facilities, adequate commercial organizations, and a sensible, sane and honest public opinion that will be reflected in a Government that will not be swayed by the whims, prejudice or fads of the moment. To perfect that transportation machine, to keep it ready to serve, to operate it safely and economically and in harmony with the public, is a very interesting and complicated problem, worthy of the best intellectual effort of any man. To solve it right will require much patience, work and money from those both in and out of the railroad service. I have come here to devote the best that is in me to this great service.

"If we are to continue to have privately owned railroads supervised and regulated by Governmental authority, and if we are to avoid ownership by the Government, the owners and users of the railroads must all work together. Personally, I do not believe in Governmental ownership in a country like the United States where our political methods are still in need of improvement.

"The policy of the Government—national and state—during the last twenty-five years seems to have been to decide rate questions in the great majority of cases in such a way that rates were rarely advanced and generally were reduced, and to introduce rules, regulations and methods that increased expenses. I am not contending at this time that this policy was and is wrong, or that control and restraint by governmental authorities should cease, although something could be said about that great question. I do, however, want to make a plea that, coupled with restraint and control, there should be protection to the owners of the securities.

"The commissions, both state and national, naturally feel the great pressure of the millions of users of the railroads for reduced rates and increased facilities. But if the rates continue to decline, or even remain on the present level, and if expenses are increased by higher wages and cost of materials and by the introduction of different appliances and facilities more rapidly than the roads can obtain money, then there is but one result for some of the railroads of the United States, and that is bankruptcy. This will naturally be preceded by a desperate effort on the part of the management to postpone that evil day as long as possible by stopping every improvement and betterment that can be stopped. I believe the commissioners, who have such great powers, realize their responsibility to the owners of the properties as well as to the users; and I hope earnestly that they will give practical evidence of their realization by permitting some advance in rates.

"Should the commissions—Federal and State—make a positive declaration that rates may be advanced so as to permit the properties to meet all of their obligations, pay a fair return to stockholders and leave a balance for improvements; they will do much for the entire country and particularly for New England. Such a declaration will at once inspire confidence and give to existing securities a better standing than they now have both here and in Europe; and will help to market new securities upon an interest basis more favorable than is now possible, because of the uneasiness in the minds of investors about the future net earnings of the railroads.

"The management of the New England lines wants to use the best financial talent it can find to help it in raising the money needed. It wishes to employ those bankers, no matter where they live, who can do the work. It would prefer to employ bankers in New York and Boston, who naturally want to help the development of the country and of the roads.

"New England can and will have the kind of railroad management and service to which she is entitled. Payment for this can be made in three ways—by some increase in rates; by the stockholders, who live in the country to be served advancing the money; by borrowing the money needed wherever it can be obtained. Probably a combination of all three plans is necessary at this time of crisis in the New England railroad situation.

"If and when the money needed is furnished the management proposes to spend it prudently in improving and perfecting properties now owned.

"The management proposes to confine its activities to the transportation business."

RAILWAY MAIL PAY DEVELOPMENTS

Ralph Peters, chairman of the Committee on Railway Mail Pay representing the principal Railways in the United States engaged in the transporting of mails, has forwarded the following letter to Postmaster-General Burleson in response to his public statement that he is "perfectly willing to consider any evidence the railroads have to show that they are not receiving adequate compensation for carrying the mails."

October 6, 1913.

Honorable A. S. Burleson,
Postmaster General, Washington, D. C.

My Dear Sir:

Under date of August 19th you advised us that you were giving careful consideration to the matter of proper compensation to the railroad companies for carrying the additional parcel post mail, and that you would inform us of the result as soon as a conclusion was reached. We gave you, under date of August 29th, additional information and argument in support of our position. As yet we have had no advice from you as to the result of your consideration of this question, although we have noted in the New York "Times" of October 1st, a

Digitized by Google

telegram from Washington, reporting an interview with you concerning the appeal that our committee had made to you for better treatment ot the railroads. In this interview you are reported as saying:

> "I am perfectly willing to be convinced that the railroads are being treated unfairly if they can produce convincing evidence. But it is a surprising thing to me that if the railroads believe they are losing money in their mail-carrying service they should be constantly seeking new mail-carrying business."

I regret very much indeed that we have not been able so far to impress upon you the honesty and sincerity of our position, and the seriousness of the situation arising from the establishment of the parcel post. It is probable that you are not familiar with House Document No. 105, being a letter and report of former Postmaster General Hitchcock on the subject of the cost of handling the mails by the railroads, nor with the reply thereto made by the railroads. These documents contain a most complete analysis of the cost, with all the information relating to the subject it was possible to furnish, both on the part of the railroads and the Post Office Department. The analysis of this information, when honestly and fairly made, shows that the railroads are very much underpaid for carrying the mails. The analysis as printed in Document No. 105 attempted to show that the railroads were overpaid, a conclusion that was reached as the result of using an unusual method for the apportionment of railroad expenses, and a method which has been characterized by the Interstate Commerce Commission on page 148, in Document No. 4198, in the matter of Express Rates, Practices, etc., as follows:

> "This contention, however, is based upon theories and assumptions to which the record gives no support, such as the adoption of an arbitrary and theoretical basis for the apportionment of railroad expenses between passenger operations and freight operations, and the further adoption of a like basis for the allotment of passenger train expenses between passenger service, baggage service, express service, and mail service."

This expression of the Interstate Commerce Commission was brought out as the result of the express companies using the method that was adopted by the former Postmaster General in Document No. 105 in apportioning expenses, to show that neither the express companies, nor the railroads, could earn a return upon their property with the proposed reduction in express rates. This argument on the part of the express companies was dismissed by the Interstate Commerce Commission with the above quotation.

Furthermore, the former Postmaster General, in Document No. 105, absolutely distorted the facts and produced false results by taking from the car foot miles belonging under the mails and transferring to the passenger car foot miles the mileage made by dead-head mail cars, storage cars, and cars used in the mail service in one direction and returned empty in the opposite direction.

All of these facts have been brought out in the hearings before the Joint Congressional Committee now investigating the subject. The present Second Assistant Postmaster General admitted these facts, and further admitted that in the statements contained in Document No. 105 the Department had made no allowance to the railroads for a fair return on the property used in connection with the handling of the mails, and in the event that such an allowance should be made, it would, beyond a doubt, show that the railroads were very much underpaid.

The Committee on Railway Mail Pay has absolutely refuted the reliability of Document No. 105 in the testimony presented before the Joint Congressional Committee, showing that with the facts brought out in the investigation reported in that document, the railroads were underpaid in 1909 at least $15,000,000 a year for the services performed by them in transporting and handling the mails and employes of the Post Office Department.

I enclose herewith a copy of our pamphlet entitled "Mail Carrying Railways Underpaid," being an analysis and refutation of House Document No. 105. I sincerely trust that you will find the time to look into the matter of the preparation and presentation of Document No. 105, and will also favor us by reading our pamphlet in criticism of it.

Now, if the railroads were underpaid in 1909, it cannot possibly be said that we are amply compensated for the service performed in the handling of the mails at the present time, when the mails include the great additional weight of the parcel post, still further enlarged by your order increasing the weight limit in the first two zones. No more convincing evidence is needed than the fact that the weight of several hundred million parcels a year has been added to a service that was already inadequately paid for.

Since 1909, the operating expenses of the railroads have been greatly increased by the increased cost of labor and material, by increased expenses arising from laws and regulations adopted by Congress, by the various State Legislatures, and the Interstate Commerce and State Public Service Commissions. Postal cars must be built of steel and equipped with all modern conveniences for the comfort of the postal clerks. Full crew laws, Hours of Service laws, all have added to the expenses. In addition to this the Corporation Tax law has further added to the burdens of the railroads. Yet no effort has been made on the part of the Post Office Department to help the railroads to get fair play in the matter of compensation for the great service performed by them in handling the mails.

You state, "It is a surprising thing that if the railroads believe they are losing money in their mail-carrying service, they should be constantly seeking new mail-carrying business." This statement cannot possibly be correct so far as the majority of the railroads is concerned. It may be the case with a few of the roads that thus hope to get more gross revenue without greatly increasing their expenses, and who anticipate better treatment from the Government in the final settlement of this matter. The large majoriy of the railroads would gladly discontinue the handling of the mails if it were possible to do so.

Digitized by Google

We sincerely hope that you will take the time to read the testimony that has been presented to the Joint Congressional Committee relating to this whole subject. We are sure that if you would do so, you would very promptly realize that the railroads have produced most convincing evidence that they have been most unfairly treated during the last twelve years, having suffered during that time many reductions in pay, with a constant increase in the work to be performed.

I enclose several articles from prominent New York papers, written by men who have read the testimony that has been presented to the Joint Congressional Committee, and who have evidently been convinced that the railroads have not been properly treated.

Appreciating your open-mindedness in this matter, and your expressed desire to give us fair treatment, we again beg leave to express the hope that you will read the testimony that has been presented, and will at an early date, give us a reply to our recommendations as promised in your letter of August 19th.

Again assuring you of our earnest desire to co-operate with your department in developing and improving this great branch of the public service, I have the honor to be,

Very respectfully yours,

RALPH PETERS,
Chairman.

PHYSICAL VALUATION

The Interstate Commerce Commission has created an advisory committee of five members to occupy an intermediate position between the technical board of engineers in charge of railway valuation and the Commission itself. Four of the members of this committee

CHARLES F. STAPLES,
of the Minnesota Railroad Commission.

EDWARD W. BEMIS,
Engineer of the City of Chicago.

are Charles F. Staples, Railroad Commissioner of Minnesota; City Engineer Bemis, of Chicago; Henry C. Adams, of the University of Michigan and formerly statistician of the Commission, and W. C. Williams, an engineer of Virginia.

It has been asserted in various quarters that the railroads have filed vigorous protests with the Commission against the enormous cost it will entail to make the physical valuation of the roads. This, it is understood, does not represent the general attitude of railroad officials on this question. While a large number of them consider that the whole scheme is utterly impracticable and that the results obtained will serve no practical purpose, they appreciate that there is nothing left for them to do but to cooperate in every way possible with the Commission in carrying out the instructions of Congress. Every effort will of course be made to carry on this work along the most economical lines, and for this reason the roads have suggested to the Commission that they be permitted to file tracings of their original maps instead of making entirely new ones. It is unofficially reported that the Commission feels that considerable merit rests in this suggestion, as the tracings would be as accurate as an original map in that the surveys are nearly always a matter of permanent record. It has not been officially reported as yet, however, whether the Commission will permit the roads to take this action as the question of authenticity

Digitized by Google

with regard to such tracings will have to be carefully considered.

Considering the general question of physical valuation, the following editorial from a recent issue of the Philadelphia *Public Ledger* is illuminating:

"If the 20,000,000 men of age in the United States were asked whether they would pay a dollar each to know the physical value of the railways of the country the vote would be overwhelmingly against the proposition. Not one in a hundred would part with his dollar for this knowledge. The wise know the valuation would not be finished before an entirely new set of conditions would exist and a new necessity would arise for determining a new total.

"Yet that is just what the physical valuation of railroad property means. No one can tell what it will cost; certainly $20,000,000 or more, which means an average of one dollar for each of the 20,000,000 men of voting age. This illustrates the curious tendency of the new extravagance which may eventually ruin the finances of the country.

"The Interstate Commerce Commission at present has far more than it can attend to with reasonable promptness. Its work is piled up; its reports are delayed; it has a wilderness of activities that tax human ingenuity. In the circumstances the Commissioners have done most remarkable work. Yet they cannot keep step with the new responsibilities that politicians and congressmen seem disposed to thrust upon them. There are over 250,000 miles of railroad in the country. Under the plan five main engineers will have charge of a district which will comprise practically 50,000 miles of railway. The organization will include squads of five under an engineer, and a squad must make an actual survey of the railroad property to the counting and the valuation of each separate tie and every other detail. At best a squad is supposed to view about 2½ miles a day. This conveys some idea of the enormous work entered upon. Absence of accurate knowledge was displayed when Congress was disposed to grant to the Interstate Commerce Commission more money than it could possibly spend in the preliminary work, and it was due to the Interstate Commerce Commission that the first appropriation may be held to $300,000. This is but a beginning; the millions will follow later.

"Various States have tried the valuation of railways and in every case the results have not been satisfactory. The purpose, of course, is evident. It is to make the railroads pay a larger share of taxation and also to search out evils in railway finance and capitalization. If it could all be done promptly and properly there might be no criticism, even of the cost, but we are entering upon the expenditure of $20,000,000 without knowing how long it will take, with a very positive doubt as to the real value of the work when completed.

"In the overhauling of taxation, which must come in the course of time, there must be a calculation of benefits just as there is in any prudent business. Possibly the $20,000,000 which we are going to spend in getting totals which will be old before they reach us may be worth while as an object lesson. We buy our folly as well as our wisdom."

COMMERCE COURT ABOLISHED

In spite of a sweeping reversal of public opinion in favor of the retention of the Commerce Court and an apparently friendly attitude towards it by both the Interstate Commerce Commission and the Department of Justice, Congress abolished it on October 4th. This was accomplished by the passage of the urgent deficiency appropriation bill to which was attached the House provision abolishing this court. Before the final passage of the measure, however, and after a spirited contest, an amendment was adopted providing that the Commerce Court judges should continue in office as additional circuit judges, but abolishing their positions whenever the present occupants resigned or retired. The part of the urgent deficiency appropriation bill referring to the abolishment of the Commerce Court reads as follows:

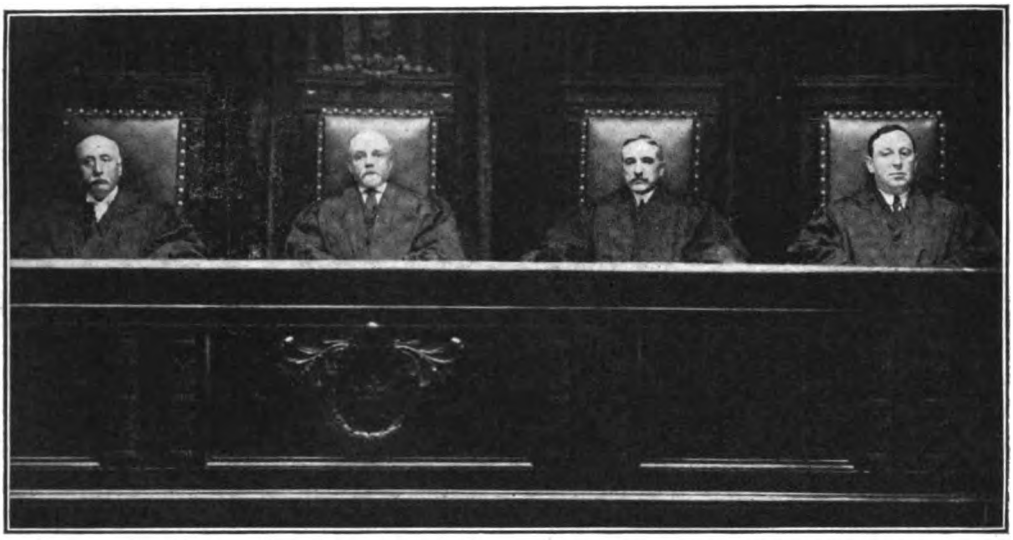
"No interlocutory injunction suspending or restraining the enforcement, operation, or execution of, or setting aside, in whole or in part, any order made or entered by the Interstate Commerce Commission shall be issued or granted by any district court of the United States, or by any judge thereof, or by any circuit judge acting as a district judge, unless the application for the same shall be presented to a circuit or district judge, and shall be heard and determined by three judges, of whom at least one shall be a circuit judge, and unless a majority of said three judges shall concur in granting such application.

"Provided that if of opinion that irreparable loss or damage would result to the complainant unless a temporary restraining order is granted any justice of the Supreme Court, or any circuit or district judge, may grant such temporary restraining order at any time before such hearing and determination of the application for an interlocutory injunction, but such temporary restraining order shall remain in force only until the hearing and determination of the application for an interlocutory injunction upon notice.

"The Commerce Court is abolished after December 31st, next. All cases pending in the Commerce Court at the date of the passage of this act shall be deemed pending in and be transferred forthwith to said district courts, including cases which may previously have been submitted to that court for final decree, and all cases wherein injunction or other orders or decrees mandatory or otherwise have been directed or entered prior to the abolition of the said court shall be transferred forthwith to said district courts which shall have jurisdiction to proceed therewith and to enforce said injunctions, orders, or decrees. Each of said cases and all the records, papers and proceedings shall be transferred to the district court wherein it might have been filed at the time it was filed in the Commerce Court if this act had then been in effect.

"All administrative books, dockets, files and all papers of the Commerce Court not trans-

Digitized by Google



THE COMMERCE COURT AS CONSTITUTED WHEN ABOLISHED.

JOHN E. CARLAND MARTIN A. KNAPP W. E. HUNT JULIAN MACK

ferred as part of the record of any particular case shall be lodged in the Department of Justice."

In view of the fact of the strong endorsements which the Commerce Court has been receiving within the last few months from business organizations and prominent men in all sections of the country, the action of Congress in abolishing this tribunal is hard to understand. The court was gaining in favor among those who appreciated the value of its work and the important part it played in the simplification of railway litigation, and it had been even strongly hinted that President Wilson was in favor of its retention. All this has apparently, however, had no effect upon Congress, who is presenting an almost daily spectacle of a National legislative body working in direct opposition to the majority will of the American people.

EXPRESS COMPANIES ACCEPT COMMISSION'S RULING

It is unofficially reported that the express companies will not contest the order of the Interstate Commerce Commission effective October 15th, entailing a reduction of their present schedules by between 16 and 25 per cent. It is understood that the companies have practically agred upon the form of acceptance of the Commission's orders and that a formal request is to be made for a postponement in order that more time may be allowed in which to prepare a new schedule. Under the Commission's ruling the new order of rates is to remain effective for a period of two years. While both the express companies and the shippers are bound in a way by the order, either will have the opportunity to appeal from the new rates if, after reasonable time, it is shown that they are unfair.

In discussing the future of the parcel post, David J. Lewis, representative in Congress from Maryland, recently had the following to say:

Postmaster General Burleson has caused several improvements to be made, and will doubtless shortly make another by admitting books to the parcel post. The one of greatest importance, however, was the recent order raising the weight limit to twenty pounds and reducing the pound rates from three and four cents a pound in the 50 and 150 mile zones to one cent a pound with a charge of five cents on the first pound, as also from a cent a pound to a half-cent in the local and rural delivery zone.

The average journey of an express shipment has been 200 miles. The 150 miles air-line parcel post, at a cent a pound, has a reach by rail of as high as 250 miles. Since this new rate averages from one-fifth to but two-fifths of the express rates on packages weighing from one to twenty pounds, the post will stand to carry all express shipments up to that limit of weight and distance. About 30 per cent of all the revenue and 34 per cent of the number of shipments by express are included in shipments of nineteen pounds and less.

But the 20-pound limit was only a "first bite at the cherry" intended to try out the postal machine. The next step will be to extend this weight limit and rationalize the rates for the

Digitized by Google

other zones. On the 300-mile zone the pound rate is now five cents—when it is conceded that a pound rate of two cents will carry a half-cent-a-pound profit to the Post Office Department. This step taken, it only remains to do what Postmaster General Burleson and Chairman Clark, of the Interstate Commerce Commission declared must come to pass, namely, "raise the weight limit to 100 pounds," which would operate to absorb 90 per cent of the entire express business.

Congressman Lewis, of course, fails to state that the success of the Postoffice Department along these lines has been due in a large degree to the efficiency of the railways and that in fact the Department itself is but one factor in the actual transaction. Furthermore, he also neglects to say that any financial success so far registered, is largely due to the fact that the Department is arbitrarily forcing the railroads to perform a service for which no adequate compensation has been provided. The Postoffice Department, notwithstanding the brag of Congressman Lewis, has never shown any marked degree of efficiency in the performance of its public functions and in fact it is well known that wasteful methods have for years characterized the system. Congressman Lewis, of course, talks for political effect, but his brutal method of disposing of a great and useful industry and of destroying millions of dollars of invested capital, will not meet with the approval of fair minded people.

It is hardly necessary to admit that the express companies have received a body blow through the extension of the parcel post and the lowering of express rates, but the men behind this vast industry are, in our estimation far more efficient than those who are promoting the parcel post, and while the latter have the powerful support of the Government back of their activities, we believe that the express companies will win out and demonstrate their usefulness in such an emphatic manner as to retain at least a good part of the patronage which has been theirs for many years.

The parcel post at the present time, is being operated with utter disregard to the fair treatment of the great industry upon which it is dependent for success. When the railroads are receiving a fairer compensation for the performance of this duty, a comparison between the effectiveness of the parcel post service and that offered by the express companies can be more intelligently made.

CONGRESSMAN DAVID J. LEWIS OF MARYLAND.

AMERICAN RAILWAY SAFETY ASSOCIATION

The movement for greater safety has at least crystallized into what might be termed a national organization, the nucleus of which was formed at a meeting held in Chicago on the 23d of September when members of the leading railroads of the United States gathered in that city and adopted methods whereby they expect their organization, known as The American Railway Safety Association, to become an active factor in the safer operation of American railways.

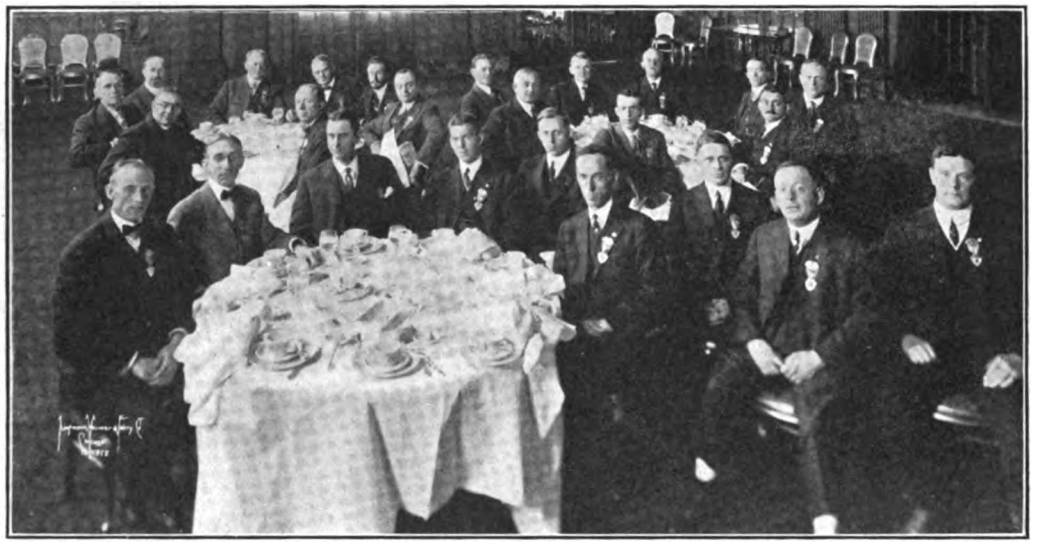
Under the scheme approved by the organization, suggestions made by railroad officials and employes on how to avoid accidents will be embodied in pamphlets and sent broadcast to the various safety committees of the country's railways.

The object of the Association as given out by O. F. Shedd, its temporary secretary, is to advance the interests of the safety movement by:

Affording members an opportunity of conferring and co-operating with each other and thereby facilitate the interchange among members of the best and most successful methods for advancing the work of the safety movement and for realizing its benefits and possibilities.

Instilling the idea of safety into the public mind and creating a sentiment which will result in the enactment and enforcement of laws prohibiting trespass on the tracks and trains of steam railways, with its consequent loss of life and injuries to persons.

Digitized by Google



THE FIRST ANNUAL MEETING AND BANQUET OF THE AMERICAN RAILWAY SAFETY ASSOCIATION HELD IN CHICAGO ON SEPTEMBER 23.

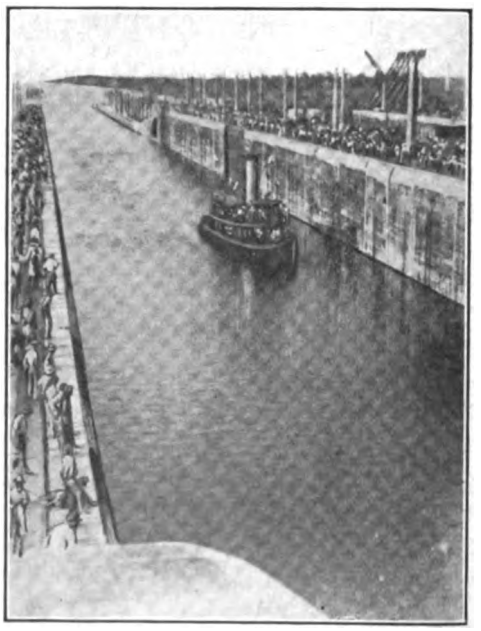
A. W. Smallen, of the Chicago, Milwaukee and St. Paul Railway, temporary president of the Association, presided at the September meeting. It was decided to withhold the election of permanent officers at the request of the American Railways Association, which, it is understood, wishes to cooperate in the formation of the permanent organization.

Before the meeting adjourned the following committee was appointed to represent the Association at the National Council for Industrial Safety in session in New York: M. A. Dow, New York Central Lines; W. C. Wilson, Delaware, Lackawanna and Western; J. N. Guild, Union Pacific, and R. C. Richards, Chicago and North Western Railway.

The Association did not complete organization plans, and will meet in December for that purpose. Various topics of interest to safety men were taken up, among them discussion of the basis upon which the different roads should compile their accident rate lists. The members inspected the safety car of the New York Central lines, which was standing at the La Salle Street Station, under the supervision of M. A. Dow. The temporary officers will remain in office until after the next meeting of the Association.

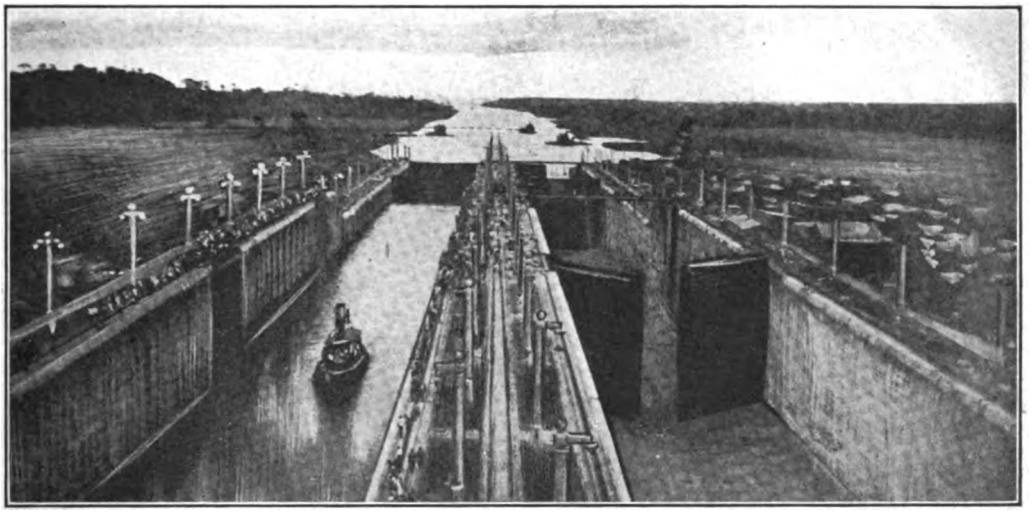
FIRST STEAMER IN PANAMA CANAL

The two illustrations herewith presented are of unusual interest in that they show the first boat entering the Panama Canal from the Atlantic side. As the last charge of dynamite which let the waters of the Caribbean into the lock was fired this little steam-



CROWDS WATCHING FIRST STEAMER ENTERING LOCK OF PANAMA CANAL.

Digitized by Google



SOME IDEA OF THE ENORMOUS SIZE OF THE LOCKS IS HERE INDICATED.

er rode into the finished locks. As indicated by the photograph, hundreds of workmen lined the banks of the Canal and cheered lustily as the boat entered the locks. From Lemon Bay to Gatun Lake is five miles. The Canal at this point was hewn out of solid rock. The mean distance from the breakwater on the Caribbean Sea to the town of Gatun on Gatun Lake is probably twenty miles. The Canal at the point where the picture was taken is more than one hundred feet wide. Limon Bay is shown in the background. Government officials and Canal Zone dignitaries were on board the steamer.

PUBLIC STATEMENTS BY PROMINENT OFFICIALS

There is a decided conservatism evidenced in the public expressions of prominent officials recently with regard to the future of railroad tonnage. While evidently willing to appear as optimistic as possible concerning future business, conditions at the present time appear so uncertain that officials who are familiar with the situation are not willing to hazard a prophecy of an unlimited continuation of the good times which have been characteritsic of the past few years.

W. A. Gardner, president of the Chicago and North Western, says:

"We expect to have the same or larger gross earnings the balance of this calendar year than we did last year. Our general business also promises well. After January 1st it is somewhat speculative as to the volume of business."

W. A. Garrett, vice-president of the Chicago Great Western, expects a first class grain movement:

"The outlook for crops is splendid, and the general trend of business should be in the same direction."

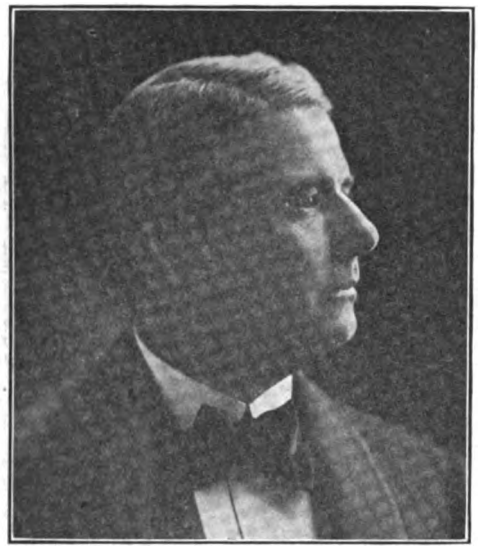
L. E. Johnson, president of the Norfolk and Western, looks for favorable business for the remainder of the calendar year, but after January 1 expects a marked reduction, due to uncertainty over results of the tariff bill, the income tax bill, and currency bill.

B. F. Bush, president of the Missouri Pacific, Denver and Rio Grande, and Western Pacific railroads:

"With the uncertainty still existing as to the outcome of the corn and cotton crops, though the latter at the present writing promises a very good yield, and the unsettled feeling of merchants and manufacturers over the pending tariff and currency legislation we cannot at this time predict with any degree of surety business conditions for the later months of the year. On the whole, however, we look for a fair business, and hope to make up by increases in other commodities any shrinkage there may be in the corn movement."

Edward Pennington, president of the Soo Line, looks for a prosperous business in the Northwest. He believes that there is nothing to hamper the continuance of good business. Fairfax Harrison, president of the Chicago, Indianapolis and Louisville, says that railroad revenues are going to be large for the remainder of the current calendar year.

Digitized by Google



CARL R. GRAY.
President of the Great Northern.

E. P. Ripley, president of the Atchison:

"On the whole railroad prospects are fair, except for drastic and unintelligent, legislative, Congressional and official acts. There is nothing the matter with us but too much politics."

C. E. Schaff, president of Missouri, Kansas and Texas says:

"I look for a large decrease in the movement of traffic during this fiscal year. We may perhaps be able to make reasonable returns for the balance of the calendar year, but after January 1st, I look for a very light traffic throughout the Southwest."

Carl R. Gray, president of the Great Northern, expects business during the remainder of this calendar year to be fully as good as for the same period in 1912.

A. H. Mohler, president of the Union Pacific and Oregon Short Line, says:

"It looks to me as if we are having a recession of business from which we will not recover in a few months. Political and financial disturbances always produce recession instead of stimulation."

F. A. Delano, receiver of the Wabash Railroad, expects business for the remainder of the year to be about on the same basis as last year. He thinks crop losses and gains will about balance each other:

"Business after January 1 will depend on tariff and currency bills," he says. "If President Wilson succeeds as well as I hope and believe he will, I think there will be a decided improvement in business when these important measures have been passed."

In a recent address before the roadmasters and maintenance of way convention held at Chicago, W. L. Park, vice-president of the Illinois Central Railroad, asserted that American lines had been unduly hampered by ill-advised, costly and pernicious laws, orders and regulations. He asserted that the money wasted in many directions through interference of those who knew little about the actual conditions of railroads, would provide real safety if the railroad managers were permitted to spend it in the proper direction. He said in part:

"Practical railroad men know the order in which they should go about the bettering of physical conditions. If a wreck occurs through a collision would-be regulators immediately propose panacea in the abolishment of wooden cars, although they do not know as yet to what extent steel cars are preferable. We pay out in maintenance of way, labor and supervision about eight per cent of gross earnings and there are paid out in claims and personal injury suits and compromises 3.5 per cent of gross, the greater part of which claims are fictitious or exaggerated and would not obtain against any other corporation or individual.

"Millions of dollars are being paid out in refinements of freight car equipment, such as the adjustment of the height of cars, wrought-iron brake wheels that are never used, instead of cast-iron, leaders on each corner of the cars and many other innovations that do not go very far to prevent personal injury.

"A railroad manager would be criminal to put money in expensive track elevation, separation of highway crossings or steel cars if the road had only sand ballast, wooden bridges, inadequate drainage and protection against washouts and landslides, items which are well known to the practical operating officials as being those which should receive first consideration.

"It is absurd to expect stockholders to go without dividends indefinitely to provide for the betterment of railroads from which they will not be permitted to obtain any additional returns. The greater part of them are poor people, who live on the income from their investment."

E. P. Ripley, president of the Atchison, Topeka and Santa Fe, in an article published in the current issue of the Official Railway List, suggests the adoption by railroads throughout the United States, of a standard freight car, uniform in all essential details.

"If, in addition," says Mr. Ripley, "we could establish a freight car pool, or an equipment company, the stock of which should be owned by the railroads, so much the better. There is no sort of doubt that we shall be forced to something of this kind eventually.

"Why not make the attempt to do it voluntarily and properly instead of being obliged to do it by law with the necessary accompaniment of fed-

Digitized by Google

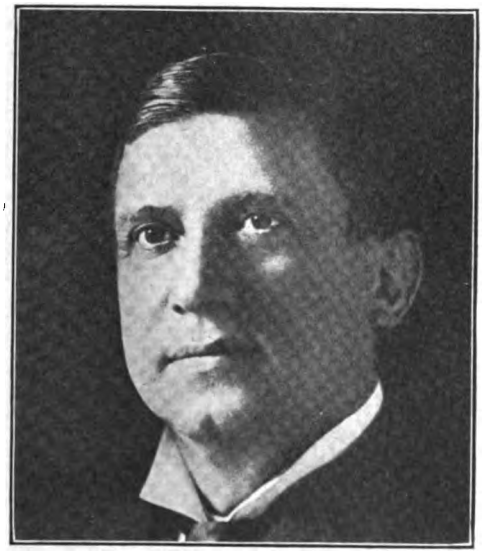
eral inspectors and the cumbersome and often impracticable notions of the particular politicians who happen to be making laws for us at the time?"

President Markham, of the Illinois Central, in discussing the general car situation, has the following to say:

"There are some business losses from car shortages, but if State and National Commissions would give railroads authority to increase demurrage charges during fall and winter, when business is at maximum and raise minimum rates on many commodities now taking unnecessarily low minimums, there would be no reasonable ground for complaint. It must be manifest to all that if railroad facilities are to keep pace with constantly increasing traffic, continued increase in cost of railroad living must be offset by increase in rates."

B. A. Worthington, president of the Chicago and Alton, attending on October 2d, the dedication of the new passenger station of his road at Bloomington, Ill., on that occasion delivered an address on co-operation, during which he said:

"The Chicago and Alton Railroad is doing all that it can do to promote the well-being and happiness of its employes. In wages, hours and service and conditions of service, the Railroad Company has shown a liberal disposition that is not excelled elsewhere, and I now take this occasion to ask them to recognize this fact, to do a little thinking for themselves, and to come and join with us in working out the best results for each other in the sense of justice and in the spirit of advancement. We must lend each other loyal earnest support, and protect the interests



CHARLES M. SCHWAB.
President of the Bethlehem Steel Company.

C. H. MARKHAM.
President of the Illinois Central.

of each other conscientiously, if we of ourselves would hope to enjoy the conditions of thrift. Squalor and discontent spell failure always, everywhere. Common sense and the will to do, built this station in Bloomington; and every day of your lives, according to the earnestness and energy which you individually inject into your undertakings, they are building for you a station—a station in society, the place where you 'get off,' the place where you 'live.' If you build well, it will be a substantial structure; the railroad could not take it away from you if it would—for it is yours, all your own, a comfort and a source of enjoyment, a shelter in the days of adversity. If you undertake a building of this nature, you will be surprised to find the 'help from the outside' that you will receive when you have demonstrated your earnestness and your good-will towards the community in general. God helps those who help themselves—we do not always understand why or how, but we must be guided by the general principles which govern, and then we cannot go wrong.

"But if, against your own better judgment, you profess any consolation whatever in finding fault with what is, criticizing and obstructing the efforts of others, you will get exactly what you are bidding for—squalor and want. You are not a desirable member of any community, but a drag on society. There are weeds in your garden, and there is dissension and want—the factors of dissolution, in your home. It cannot be otherwise.

"It is up to the individuals to choose what they want and to make a legitimate worthy effort to accomplish it—the balance is easy, but you will have to think for yourselves individually and act for yourselves, as no one can do that for you. And to have your own rights respected, you must respect the rights of others, and defend them if you would be defended in your own rights.

"And as for workmen in our shope, I want to ask them to take a broader view of the situation;

Digitized by Google

stop this nursing of discontent; see if you cannot find more substantial benefit in increasing efficiency, and promoting economy of workmanship. For a number of years past we have been struggling at cross purposes—the Railroad Company has made liberal concessions, but these apparently only whet the appetite for unreasonable conditions of service which the Railroad Company cannot grant—the closed shop and constant interference with the functions of management of the property. I doubt whether you have profited by working half time, or but little better. So far as the Railroad Company is concerned, we cannot expect to retain good men in the service, with so much uncertainty about their employment. We must have an efficient, reliable and loyal set of men in our shops; we want to satisfy them in the matter of compensation and conditions of service. We want them to build homes and rear families here in Bloomington, and the Railroad Company is going to use every means within its power to protect that kind of men, but the Railroad Company can do very little if the men themselves refuse to assist or to be assisted."

PENNSYLVANIA RAILROAD TO SELL COAL HOLDINGS

President Rea, of the Pennsylvania Railroad has announced that the Board of Directors of the company had decided to sell its security holdings in the anthracite coal companies which have been attached to its system for nearly forty years. The Susquehanna Coal Company is the principal operating company and selling agency for these companies.

The action of the Pennsylvania Railroad is significant. While this company has never been a very large factor in the anthracite trade, the character of its relations with certain coal companies was essentially the same as that of other anthracite carriers; and, in taking the action it has, it has at least implied that the direct interest of railroads in coal properties is no longer in harmony with the interpretation of the law likely to be made by the courts.

It is reported from Washington that the announcement of the Pennsylvania Railroad was particularly pleasing to the officials of the Department of Justice as being in conformity with the Government's position that the coal carrying roads should be divorced from coal mining companies. Among certain railroad officials, it appears to be the belief that Attorney General McReynolds' attack on the so-called "hard coal trust" will probably be the most important and far reaching move he will make during his term. Suits under both the Sherman anti-trust law and the commodities clause of the Interstate Commerce Commission act are already pending against the Reading and the Lackawanna railroads in an effort to separate them from their coal mining companies. The question of dealing similarly with the Erie and the Lehigh Valley is reported to be under consideration.

While the action of the Pennsylvania Railroad does not, in itself, admit the illegality of their interest in certain coal properties, it is undoubtedly generally interpreted that way, and does not tend to strengthen the position of other carriers in this particular. The Pennsylvania Railroad has gained an enviable reputation for longheadedness in discounting the future, and its actions generally accurately indicate which way the wind is going to blow. In fact, the announceemnt of the Pennsylvania Railroad that it would sell its security holdings in anthracite coal companies coming as it did simultaneously with negotiations for the disposal of its controlling interests in the Cambria Steel Company, means that this railroad has decided to cut loose from every part of its business which is not strictly necessary to transportation.

Another motive attached to the Pennsylvania's action is that the need for protection against rebate extortions and discrimination in tonnage and prices, which caused such properties to be acquired originally, no longer exists, as a result of the stricter regulation of big business. The railroad can now use the capital it has tied up in such industries to much better advantage in its transportation lines.

The railroad's anthracite coal properties turn out about 9 per cent of the entire anthracite production, the Pennsylvania's shipments in the eight months ended August 31 being 4,076,893 tons against 45,709,606 tons for all companies. Its investment in the Susquehanna Coal Company, its chief operating company, is represented by $2,136,000 stock and $6,000,000 5 per cent certificates, but the properties are probably worth much more than this $8,136,000 face value.

The railroad's Cambria Steel stock amounts to $22,504,100 par value. It is quoted around $52 (the par being $50), so that even at market prices this means approximately $25,000,000.

Its holdings of Pennsylvania Steel stock exceed $20,000,000 par value, but would hardly bring over three fourths of that at present. This gives a rough approximation of at least $50,000,000 as the market value of the anthracite coal and the two large steel properties owned by the railroad.

Contemporary Opinion

Railway Financial Results for the Fiscal Year.

SLASON THOMPSON, Director of the Bureau of News and Statistics, of Chicago, in a recent bulletin discusses the financial results of railway operations for the fiscal year ending June 30th. He points out that while the gross revenues for the year show a normal increase, they have been attended by such an abnormal increase in operating expenses and taxes, as to result in a net income wholly inadequate to meet the pressing demands ot the American people. To quote from the bulletin:

"How many persons know that, although the gross revenues for the fiscal year 1912-13 exceeded those for the fiscal year 1909-10 by over $384,000,000, the net income of the railways increased less than the four odd millions of this imposing figure?

"In the meantime the railway mileage in the United States had increased 10,000 miles, the total trackage over 25,000 miles, and the facilities and equipment in proportion.

"It is the struggle to keep pace with the facilities and equipment demanded by the normal growth of the country and its traffic that makes the necessity of the railways for higher freight rates so insistent and meritorious."

Mr. Thompson presents a table which covers the gross revenues of the railways by months since July, 1907, which shows that the total for 1912-13 shows an increase of nearly $750,000,000 over that for 1907-08, but only $584,000,000 over 1906-07, the year before the panic. These monthly figures are very valuable indices of the fluctuation in railway traffic. For instance, the figures for October, 1912, show that in that month, the railways handled over 40 per cent more traffic than in January, 1912. This, of course, means that certain seasons of the year the railway plant is being operated at less than 70 per cent of its capacity with a certainty that at another season it may be taxed beyond that capacity. To provide against this continual recurring contingency, in the face of declining net revenues, is a financial problem for which the railways are seeking in vain for a solution.

In another table, Mr. Thompson presents the operating expenses by months for the same years. It is pointed out that the general trend of such expenses is best studied in the ratios of earnings. As the table indicates, the telltale ratio of 69.40 per cent for 1913, is the highest since the abnormal 69.67 per cent of 1907-08, when the railways were unable to meet the collapse of $300,000,000 in earnings with a corresponding curtailment of expenses. Through drastic economies this ratio was reduced to 66.12 per cent in 1909, from which increases in wages and in cost of materials have gradually forced it to a point where the largest traffic on record is not sufficed to keep the operating ratio within the margin of safety. A further study of this ratio discloses the effects of the disastrous floods of last spring. An operating ratio of 73.40 per cent for the second half of the fiscal year is unprecedented.

In another table, Mr. Thompson presents what might be termed a bird's eye view of the income account of American railways before and since the panic of November, 1907. Mr. Thompson asserts that no interpretation of the figures presented in this account is sound that ignores the expansion of the plant engaged in the transportation business of the American people. On its face it shows an increase of 21,363 miles of line since 1907. That is to say, a mileage equal to the total mileage of the British Isles has been added to the transportation facilities of the American people. Behind this is the fact that there are nearly 10,000 miles of operated railway in the United States not officially reported. In 1911 the official and unofficial mileage operated was stated to be 251,109. Since then over 7,000 miles of new line have been built.

Moreover the total trackage of American railways has increased from 327,975 miles in 1907 to 375,000 miles (computed) in 1913. As each mile of added track stands for the expenditure of an average of $40,000 per mile in land, labor, terminal facilities and all the appurtenances that go to the make-up of our American railways, the railways of the United States represent today an investment of approximately $2,000,000,000 more than in 1907. And the investment has been imperative in the face of advancing operating costs and a stringent money market.

This phase of the situation means that the fixed charges payable annually from income of the railways of the United States were fully $100,000,000 more in 1913 than in 1907, while the fund from which they were payable was only $82,000,000 greater, allowing nothing for the increased reserves for improvements and betterments and surplus.

Mr. Thompson concludes his review of the situation by stating that "while the Commission hesitates to perform an obvious duty, American railway credit is discredited in the money markets of the world. The necessity for an advance in freight rates which was urgent in 1910 is still more pressing to-day. The railways can know no genuine relief while operating expenses and taxes absorb over 73 per cent of their revenues derived from carrying freight and passengers at unremunerative rates."

Some Accident Figures.

IN another section of this issue, is printed a diagram which graphically portrays a heavy reduction in railway accidents during the course of the past few years, rather than an increase, as appears to be the popular belief. One of the universal failings of human nature is the temptation to exaggerate any evil and to develop therefrom a criticism which often contains so small an element of truth as to prove extremely misleading. "Leslie's Weekly" in commenting recently on the series of accidents which have, during the past year, occurred on the New Haven, and which have aroused universal newspaper criticism, has the following to say:

"People read sensational headlines but they never look at figures. The story of a dreadful accident on a railroad is at once accepted as a proof of gross mismanagement. If two or three accidents on the same railroad happen to follow in rapid succession, the whole line is condemned

Digitized by Google

as unsafe and its management denounced as untrustworthy. Yet a popular writer has said that 'misfortunes come not singly but in battalions.' Who has not felt the force of this statement?

"Harsh criticisms of the New Haven Railroad have been heard and investigations by prejudiced authorities have been reported by prejudiced reporters of a vicious yellow press. We now have come up suddenly against a few stern facts. Let our readers have patience with the tale the truthful figures tell: In the ten years, covering the incumbency of President Mellen of the New Haven, it has operated over 5,000,000 trains, and carried a total of over 755,000,000 passengers with six accidents in which passengers were killed, and with only one fatality for every 26,000,000 passengers carried. In six of the ten years not a passenger lost his life by reason of accident to a train, though in that time 441,000,000 passengers were carried in approximately 3,500,000 trains."

Wrecks and Their Reasons.

(From the "Wall Street Journal.")

THE Interstate Commerce Commissioner who has been headlined to the effect that "railroad slaughter must cease" voices the desire of railroad managers no less than that of other citizens. Much has rightly been made of the use of antiquated wooden cars on busy trunk lines. Bricks of a sort can be made without straw, but no one has ever yet built a steel car without money.

Mr. Sulzer and the other sages at Albany have arbitrarily imposed upon the railroads of this State the useless expenditure for idle brakemen of $2,000,000 annually, enough to pay interest on the cost of more than 3,000 steel passenger cars. In the opinion of our astute lawmakers, which has been substituted for the unanimous judgment of trained operating officers, easy berths for superfluous trainmen must take precedence over purchase of steel cars or any other plant improvements.

This is not to acquit any company of the grave responsibility that rests upon all railroads which at this late day continue to use wooden cars where operating conditions call aloud for steel. Instead of one, there are a score such railroads. But what is the result going to be if the country becomes obsessed with the idea that steel cars are a sure preventative of railroad disasters? What of the effect upon the minds and conduct of a million and a half of railroad employes, if the newspapers and our public men support the preposterous cry that wooden cars, which have been in universal use for three-quarters of a century, have suddenly been discovered to excuse and condone every sort of lapse and dereliction in duty? It is important enough to abolish wooden cars, but it is ten times as desirable to abolish rear-end collisions.

No one who has read the searching analysis of the Wallingford wreck and its causes from the lips of a veteran railroad officer, printed in "The Wall Street Journal" can entertain much doubt as to where this problem must be attacked. It is 99 per cent a question of discipline, and discipline must flow from above downward through the operating staff. The right sort of division superintendent, especially if he has the right sort of general manager over him, cannot be balked of his determination to enforce his orders and the book of train rules even by the railroad brotherhoods, as officers of these organizations themselves admit.

By all means let us have steel passenger cars as rapidly as they can be built—and paid for. But let us look the facts squarely in the face, and at least try not to mistake one thing for another, not related.

A Real Railway Problem.

(From the "New York Journal of Commerce.")

THE outcry in Congress since the recent wreck on the New Haven has all been directed to the question whether the road had sufficiently equipped itself with cars of the latest type and with safety devices of a satisfactory kind. There has been very little inquiry whether the legislation of Congress was or was not responsible for the financial situation that made it necessary to proceed more slowly perhaps than some of the managers would otherwise have chosen. And these remarks do not apply solely or even in a primary way to the New Haven. They are quite as applicable to other lines which are in a much less satisfactory condition. It is not enough to say in reply that the lines are suffering from over-capitalization or that in years past they have been "exploited" by persons who were eager to make a profit for themselves and who left the roads burdened with debt and overloaded with large issues of stocks. Whatever truth there may be in such charges, and in the case of many railways they are undoubtedly well founded, they have little to do with the current day problems, for that can be met only by making provision for meeting conditions as they exist. It is well to bear in mind that if the railways of the country are now to be turned into unprofitable, non-income yielding enterprises, they will deteriorate in equipment, in efficiency and in general physical condition. That under such conditions they will suffer from the hazards of accident and of the general disorganization that comes from lack of interest on the part of their managers is inevitable.

Congress in dealing with this subject would do well to bear all these facts in mind and to endeavor, if possible, to apply a moderate degree of fairness to its treatment of the situation. The railroad question cannot be settled by restrictive legislation, but must be dealt with upon a broader basis. It must be considered as a general issue whose elements involve the rate problem among others. The broader relations of the roads to the public are fundamental in the discussion. Mere investigation and destructive criticism may in fact render the conditions a good deal worse than they now are instead of improving them. It is probable that there will be railroad legislation during the coming winter, partly with a view to extending the control over rates now exercised by the Interstate Commerce Commission and partly for the purpose of controlling issues of securities. Should these two subjects be dealt with, it will be desirable to give due weight to the fact that the railroads cannot make bricks without straw and that if they cannot get capital they cannot be expected to provide what capital will buy. This no doubt

Digitized by Google

is an unpleasant thought to "progressive" legislators, but it represents a condition the results of which they cannot expect to escape.

Signals and Steel Cars.

(From the "New Bedford Standard.")

AMONG the easiest occupations of an editorial chair is running a railroad. It is curious, but there are writers of editorial articles who would never agree that a railroad man could by any possibility carry on a newspaper, who apparently have no doubt of their own perfect competency to run a railroad. At least, that is what we gather from the tone of the comment on the disaster in Connecticut.

Now, we believe that a newspaper is entirely justified in drawing general conclusions as to the fundamental principles of securing safety in railroad operation. These are, indeed, in essence, the same as underlie safety in any activity. But when the details and technicalities of railroad operation are involved, it is just as well to regard the stop signals. In the instance of this latest catastrophe, there is a wild call for the adoption and the installation of a new signal system, made to a very great extent by persons who have only the vaguest idea of such signals as are now in use. It is alleged, and for all we know accurately, that the system in use on the stretch of track where this accident occurred was antiquated and inadequate. That may be true. But it is also a truth that trains have been run hundreds of times under its operation with safety. The demonstration has been perfect that if it is properly installed, is properly managed by the operator, and is properly observed by the engineer, it is an effectual preventive of accidents. For it has prevented them. That some other system would be better may be agreed. We should have no hesitancy in agreeing to it, on the principle that there is nothing which mankind has made which cannot be improved. But a nontechnician is entirely out of his legitimate field when he undertakes to assert that this or that method answers requirements. He is especially out of his field when he alleges that any mechanical system can be a sure preventive of accidents. If he actually had the responsibility he would be less forward in his assertions. By all means, let the work of improving signal systems go on; but there is only delusion in the idea that the best possible system can get rid of human responsibility. It cannot. The constitution of things prevents. That is fundamental. It is a point on which the lay commentator must continually insist. But, if he is wise, he will let the technicians and the specialists make the machinery.

Much the same observations apply to the demand for steel cars. It certainly looks as if the demands were justified, and as if the steel car, under some conditions, would be a life-saver. Yet millions of persons have safely traveled in wooden cars, and the first cause of disaster has nearly always been back of the car itself. There is the possibility of safe travel in wooden cars demonstrated beyond cavil. There is also the possibility of danger, yet there is rarely, if ever, a case where the origin of the danger is not outside the car. Beside, putting reliance on steel cars is good only within limits. Given, as happened the other day, a heavy locomotive drawing a heavy train at forty or more miles an hour, and crashing into the rear of a heavy train which is standing still, somebody is going to get hurt, whatever may be the material of which the cars are made. One who has attentively considered the laws of motion and the impact of bodies ought to see that. The force of the shock must go somewhere; and where more certainly than into the bodies of the passengers in the rear cars? If steel cars are going in any degree to induce looseness in running trains, under any theory that travellers in them are immune, there had better not be steel cars.

When all is said, the conclusion comes back to the same place. The fundamental condition for safety is scrupulous carefulness of operation —a carefulness which must extend from top to bottom of railroad management, where every individual appreciates his own personal responsibility and lives up to it. The higher the place, the greater the responsibility, of course. But the old saying that a chain is no stronger than its weakest link is peculiarly applicable here. On this sense of responsibility, place all the mechanical safeguards that are necessary and without stint, and let them be put there by men who know rather than by men who criticise. Yet after all these are provided there will never be a moment when irresponsibility and carelessness, even in the most obscure places, may not drive the train to destruction and death.

Keeping in Touch with the Public.

THE "Literary Digest" in discussing the attitude of the modern railway executive towards the traveling public, has the following to say:

"The railway executive who disregards the wishes and the opinions of his traveling public is getting to be as old-fashioned as the red-flannel petticoat. He may not be totally extinct, but his type is rapidly being relegated to the place where good old wagons go when they break down. The wide-awake railroad president or general manager knows it is poor policy to allow his company to get on bad terms with the people who pay in the wherewithal, and he never neglects an opportunity to find out what his patrons think of the accommodations he is giving them. One railway head recently hired a young man to do nothing but find out what the patrons are thinking about the service and to report to the main office of the company cases of negligence on the part of employes. The man in the new position is to the railway executive what 'whiskers' are to the cat tribe. He is a feeler who warns when there is danger of getting 'in bad' with the public."

The Plethora of New Laws.

CHARLES NAGEL, former Secretary of Commerce and Labor, contributes an article to the current issue of the "American Leader" on "New Laws and no End" which is of more than current interest. Extracts are reproduced below:

"Nothing is more certain than that the enactment of a multitude of laws does not make for the majesty of the law or for the rule of the people. On the contrary, indiscriminate legislation augments the power of the Executive, because the need for his discrimination and for

Digitized by Google

the exercise of his discretion is constantly increased. No Executive can to-day enforce all the laws all the time. He has neither the funds, the administrative machinery nor the time. Obviously, he must determine which laws shall be enforced; and to that extent his authority is made personal and arbitrary.

"Unconsciously the people have learned to accept this situation. The whim of the people is reflected in legislation; the will is expressed in executive action. This accounts for the more and more common demand upon the Executive to right evils, law or no law. This explains the people's applause for an Executive who assumes the reins of government and dictates what ought to be done in all its branches. We are tired of our own resolutions and declarations and rules. We demand action and we are showing a dangerous indifference to the fundamental principles of a constitutional government.

"In another direction this tendency to overlegislation is fraught with danger. The reliance of the individual upon governmental aid is a two-edged sword. No man can lean upon another for help without making corresponding surrender of personal independence. All government contemplates a measure of such mutual concessions; but when legislation embarks upon class recognition the protection afforded is temporary, and the peril incurred is permanent.

"Safety First" on the Southern Pacific.

HOW the Railway Clubs of the Southern Pacific have contributed to the "Safety First" movement is well described in an editorial from the Los Angeles "Times":

"The common carriers of the country have learned that John Barleycorn in the habiliments of Death sits at many a railroad crossing, at many a switch, and on many a siding, and rides upon the pilot of a hundred engines every day in the week. They might have nailed up the saloon door to their employes, and practically did so by forbidding a trainman under pain of discharge to enter any habitation where John Barleycorn had his domicile. The rule would have done little good if they had not discovered a 'more excellent way.'

"Block systems are good, and so are all other mechanical devices, but unless you get the man at the throttle valve to leave whiskey alone, deaths will occur on the track. By the introduction of a 'more excellent way' a report upon the Southern Pacific system shows that in four years ended July 30, 1912, 150,000,000 persons had traveled on trains of that road 'without killing a single passenger through collision or derailment.' In one small railroad town of 3,000 inhabitants, twenty-nine saloons had flourished, and kept on flourishing in spite of the rule forbidding trainmen to patronize these places. Then the road introduced its 'more excellent way' in the establishment of a clubhouse to take the place of the saloon, and six months later a dozen of the saloons had closed their doors because they would not pay. Two years after the club was opened, only seven of the twenty-nine saloons remained in business. Guidance was superior to obstruction, and education left prohibition away behind.

"Something had to be done, for no man was required to pay entrance fees nor monthly dues to enter a saloon, so the railroads had to make their clubs as free as water that runs in the rivulet or as the air that circulates around the globe. The saloon is the most democratic place on earth, where all distinctions are left behind as each man enters the door. So in the clubs all men stand upon a plane of social equality. Another thing, the railroad clubhouses assume good behaviour on the part of all who enter them, and there is never seen a sign prohibiting swearing, smoking, expectorating, or any other improper act. 'There are no rules of conduct.' The men are put upon their manhood and upon their good behaviour. In an article in a recent issue of the 'Outlook,' the discussion upon this subject closes as follows: 'Social welfare workers will find food for reflection in the remarkable success of this enterprise, which vigorously suppressed every tinge of paternalism and patronage in order to lay hands upon the most elusive, unwitting individual, the adult, independent, self-respecting worker, and keep him out of danger the danger zone of the saloon.' And let all men rise up and sing 'Selah.'"

Taking Steps to Avoid Car Shortages.

THE railways in the various sections of the country are vigorously engaged in taking all necessary steps to avoid a car shortage during this fall and winter. Damaged rolling stock is being repaired as rapidly as possible and all cars available are being put in first-class condition. Shippers are being appealed to in an effort to have them unload cars promptly and to their fullest capacity and steps are being taken to provide for quick handling of cars at terminals and transfer points. The following statements published in a recent bulletin distributed by the Railway Business Association, dealing with the car situation, are of peculiar interest at the present time:

By HON. EDGAR E. CLARK,

Chairman, Interstate Commerce Commission.

Periods of so-called car shortage occur each year, and continue for more or less protracted periods. Investigations which the Commission has made and information which it has gathered indicate that the so-called car shortage is always contributed to in a great measure by the fact that large numbers of cars are rendered unavailable for transportation because they are held under load for storage or reconsignment purposes, and because other large numbers of cars are held in the yards of carriers awaiting switching or movement.

The average movement of freight cars on the railways of this country is absurdly low. It is difficult to see how the situation in a congested terminal where many cars are already awaiting switching or movement would be improved by additions to the number of cars. Securing the highest possible efficiency from the existing number of cars would, to my mind, afford more relief than increase in the number of cars, and I entertain no doubt that the efficiency can be greatly enhanced by cordial co-operative effort between the shippers and the railway companies in the direction of prompt loading and unloading on part of the shippers and prompt movement on part of the carriers.

Digitized by Google

I am sure that much has already been accomplished in this direction and I hope that the effort will not only be continued but will spread until it is participated in by all interested. All interests will thereby be served and promoted, and the congested period of the approaching winter will be thereby greatly relieved.

NATIONAL INDUSTRIAL TRAFFIC LEAGUE.

Resolution Adopted May 24, 1913.

WHEREAS, There have been frequent periods when the available supply of empty cars has not been sufficient to meet the requirements of the commerce of the country; and

WHEREAS, There has been waste in the car supply, for which both carriers and shippers are responsible, by reason of failure to promptly repair bad order cars, delay in movement, unnecessary detention loading and unloading, holding under load with material which should be unloaded, failure to utilize available car space by loading as near carrying capacity as conditions permit; therefore be it

RESOLVED, That it is the sense of this meeting that the duty rests upon carriers and shippers alike to make every effort to increase the efficiency of car supply by the elimination of such waste as they are responsible for; and be it further

RESOLVED, That the League continue its campaign, by circular and otherwise, as may be necessary to secure the maximum use of transportation facilities.

By J. KRUTTSCHNITT,

President, American Railway Association.

There can be no doubt as to the responsibility that is felt by railway managers with regard to furnishing an ample supply of cars to enable the great traffic of this Continent to be satisfactorily moved. The mere multiplication of the car units will not accomplish this. It requires vigilant supervision to prevent unnecessary delay in handling so as to obtain the maximum number of carload movements in a given time. A car unnecessarily idle is a distinct economic loss.

The proportion of time when a freight car is idle awaiting either loading or unloading is necessarily large. The reduction of this time to a minimum is a consummation that all railway officials have earnestly sought to obtain.

It is therefore satisfactory to note that so many shippers have come to realize the enormous loss in the movement of traffic that is entailed in the aggregate by even slight unnecessary delay on their part when multiplied by its effect upon the entire equipment, and are so heartily co-operating with our railways in endeavoring to correct the evil.

Taking a broad view of the case the best interests of both shippers and carriers in this matter, as in many others, are identical, and by working harmoniously together the successful operation of the business of the country will surely be largely conserved.

Commercial Organizations Assisting the Railways.

IT is evident that trade bodies are making a greater effort than ever before to assist the railways in avoiding a car shortage during the fall and winter months. Suggestions are being sent to members as to how they may prove helpful and in various ways the matter is being brought to the attention of shippers generally. The following from the "Journal" of the Philadelphia Chamber of Commerce is illustrative of how many organizations are assisting the railways to avoid the threatened shortage:

"The latest reports from the Car Efficiency Bureau of the American Railway Association show that there is a very small net surplus above shortage of freight cars in the United States, while the volume of traffic at this time is considerably in excess of the same period last year. Based on existing traffic and the present prospects of large crops for the fall, the probabilities are that there will be a car shortage during the fall and winter months. Shippers and consignees can render some very valuable assistance in keeping the shortage down to a minimum by co-operation with the carrier, and it is believed that observance of the three following measures will very materially help the situation:

"First, the shipping of coarser commodities, such as lumber, coal and cement, should be undertaken within the next few weeks, so as to get as much of it as possible out of the way before the advent of the heavy fall traffic.

"Second, expeditious loading and unloading of cars.

"Third, heavy loading of cars."

State-Owned Railroads.

INTERESTING information regarding State-owned railroads, their number and mileage, has been issued in a return published by the British Board of Trade, London.

In Great Britain, there is no State-ownership, but in the British Dominions over seas, it figures more or less. The return, it may be said, dates up to 1911.

Canada in that year had 26,278 miles of privately owned and worked railroads against 2,018 miles State-owned and operated, and 102 owned by the State and privately worked. Australia had 16,079 miles State-owned and 1,934 privately owned, and operated respectively by the State and private owners. South Africa had 7,548 miles State-owned, and 545 privately owned; New Zealand, 2,508 State-owned, and but 29 miles privately owned; and Newfoundland, 723 miles owned by the State but worked by private (company) owners, and 47 privately owned and operated.

India had 32,839 miles of railroads. Of them 6,874 were State-owned and operated, 18,245 State-owned but privately operated, 1,662 owned and operated by native States, and 1,648 owned by native States but worked by companies.

In seventeen other British colonies and Protectorates, there were 3,525 miles of railroads privately owned.

This return gives in all forty-two States other than British. In thirty-two of these, the railroads are owned, either wholly or in part by the Governments.

Who Are Concerned in the Proposed Freight Rate Advance?

By EDWARD G. WARD
EDITOR OF THE RAILWAY WORLD

THE following appears in a syllabus of a decision rendered by the Commission in 1888, following an investigation of rates of the Chicago, St. Paul & Kansas City R. R. Co.

> "The commission has no power to compel a railroad company to increase its rates which are supposed to be so low as to be ruinous to itself or to its rivals.
>
> "The provisions in the Act to Regulate Commerce, that all rates shall be just and reasonable, was a provision inserted for the protection of the general public, and not for the protection of the carriers against the action of their own officers or against the action of rivals. The carriers were supposed to have means of self-protection against unreasonably low rates in the power they had to make the rates themselves."

While this expression was made in connection with conditions where the carrier had voluntarily instituted low rates to a large competitive center without making similar reduction to related points the expression has, nevertheless, been regarded as a fundamental and controlling principle in connection with the Commission's powers, and the public was not slow to realize its opportunities and began to look about to see where it needed protection.

Complaints began to pour in directed against alleged unreasonable charges or discriminations and the correction invariably sought, if not always directly prayed for, was the lowering of some rate or the abolishment of some alleged discrimination by an adjustment *downward*. The law was regarded as designed only for shippers and it would have been futile to search the briefs of complainants' counsel with any thought of finding the suggestion that the matter complained of might be remedied by the Commission advancing certain rates. While in innumerable instances a slight advance in rates would have removed discrimination, with no actual hardship to shippers or competing communities, it was always the carrier that was to be disciplined. It is only in recent years that the Commission has occasionally, when requiring the removal of discrimination, left it optional with the carrier to increase certain charges or lower others.

It is true that in former years the carriers could, as now, initiate and file rates, and these could have included reasonable increases, but the growing activities of the public and its agencies have gradually restrained the carriers from inviting litigation and expense in the face of known opposition, and induced caution in the matter of rate adjustments involving advances, even where they were manifestly reasonable and equitable.

While the carriers still have the right to initiate new rates, the Commission now has the added power of suspension. As anyone may apply for a suspension and as, in a majority of such cases the reasons appear sufficient to the Commission to grant the application, the delay and subsequent disposition of many of these cases have been discouraging and operated to further deter the carriers from undertaking adjustments which tend to even slightly increase earnings, unless the justification shall be prima facie and there is some indication that they will be satisfactory to shippers and the Commission.

Under this gradual suppression of the carriers' initiative, many adjustments involving moderate advances which could have been made from time to time without serious disturbances to any commercial community, and which were fully justified by the demands for new facilities and improved service as well as to meet an increased cost of service, have been approached hesitatingly or abandoned with the result that, in numerous instances, the carriers have been restrained from exercising an inherent right in the management of their business and one which is recognized in the conduct of every other business, viz., that of adjusting the selling price of the commodity produced upon the basis of costs, labor conditions, proper facilities, the value of the convenience and accommodation to dealers or purchasers, including a living expense, a reasonable return on investment and some surplus. To these conditions may, in a large measure, be attributed the inability to keep the selling price of transportation abreast of the enhanced cost of what may be termed the *raw material* and running expenses, a condition not found in modern industries.

Labor strikes may occur; mines, factories and furnaces may shut down. All commercial business ceases on Sunday. The Government Post Office Department works only half time, and other recognized cessation of business occurs. The public accepts and is adjusted to these conditions. With the operations of the railroads the proposition is quite different. It may well be asked what would be the condition of the public mind and the authorities at Washington if all passenger trains were laid up on Sundays or if both freight and passenger service stopped entirely for twenty-four hours in the middle of the week for general repairs, as is often necessary with large plants. The public demonstration which would follow would be interesting if not pleasant. The facts are that the railroads, from public, social and humanitarian considerations, can never stop, and

Digitized by Google

must adjust their operations to every kind of regulative supervision and control which has so completely encompassed every branch of the service.

The time has arrived when a broader view should be taken by the public of railway affairs and a more general recognition be given to the fact that the protection of the public under the law means not only their protection against excessive charges or discriminations, but also the protection of investments, and a full and fair consideration for the welfare of the great number of persons who, as investors, are equally entitled to the law's protection and further, that a reasonable adjustment in the selling price of transportation, which will more nearly accord with the cost of production, shall be permitted and accepted as necessary to secure this protection.

The great body of railway investors look to the management of these corporations for a reasonable return on their investment, but in whatever capacity they are interested, either directly as investors or indirectly as savings bank depositors, insurance policy-holders, employes or others who are in any degree dependent upon the earning ability of the carriers, the time has come when they should manifest their interest and influence, and thus assist the carriers to continue to conduct a progressive plant, to sustain their credit in the world's financial markets and to suitably compensate those, who by their investments, have made the development to the present stage possible.

A few figures will show the extent of interest in the question of adequate earnings for the railroads. Take to begin with the five principal life insurance companies who at the end of 1912 had 2,780,226 policyholders and the two principal so-called industrial insurance companies who had 20,000,000 policy-holders. The five life companies referred to owned railroad bonds to the extent of $922,353,437 and stock value at $48,358,493. The two industrial companies owned railroad bonds to the amount of $226,497,856. We have here a total number of policy-holders of 22,780,226 and total bond holdings of $1,148,851,293 and of stock approximately $48,000,000. It has been estimated that of the money which policy-holders expect insurance companies to have available as guarantee to meet policy requirements, nearly thirty-three per cent. is invested in securities of the railroads. This suggests that every holder of an insurance policy has a direct concern in the earnings of railroads.

Official records show that there are somewhat over 10,000,000 depositors in savings banks and that in 1912 these banks held railroad securities to the extent of $794,083,006, while State and private banks and loan and trust companies held similar securities amounting to $453,165,423. It is conservatively estimated that of the entire population about thirty-three per cent. have a direct interest in railroads through their private bank deposits.

Again railroads are the largest consumers of coal, and it is well known that the operations of the coal industry are largely dependent on the requirements and operations of the railroads. In the coal industry there are 725,030 employes. In a recent year, the railroads paid for coal alone $215,000,000, of which over sixty per cent. went to the labor engaged in its production, or approximately $130,000,000.

We come next to the men engaged in producing railroad supplies. This number has been estimated to be from seventy to seventy-five per cent. of those engaged in industrial activities. It has been conservatively estimated that the number of men employed in the railway supply business and allied industries whose product to some extent is consumed by the railroads, is approximately 1,500,000.

In 1912, there were 1,728,000 railway employes, and their compensation was $1,268,977,272. As compared with 1910 the increase was 29,183 employes and $125,251,996 in wages. It is estimated that of the latter amount $21,000,000 is due to the increase in number of employes and $104,000,000 to increased compensation due to advance in wages. Of each dollar earned by the railroads, forty-four cents is paid to labor. Since 1907, the number of employes has increased only 3.4 per cent., while their compensation has increased 15.6 per cent.

Last, but not least, we should not overlook the stockholders the sole income of many of whom is derived from railroad securities. Of these there are approximately 400,000, and the average rate of dividend, as stated by a recent issue of Poor's Manual, is about 4 per cent.

In the opinion, on the Advanced Rate Cases of the Eastern railroads, rendered two years ago, the Interstate Commerce Commission indicated what dividend a railroad should earn on its stock, and took the condition of the New York Central, Pennsylvania and Baltimore & Ohio as an illustration and stated:

> "We are of the opinion that the sum remaining after the payment of fixed charges (including as a fixed charge the dividend on the preferred) should be between 7 per cent and 8 per cent. on the common stock. It should have sufficient earnings so that it may pay a dividend of 5 per cent. on its common stock and carry 2 and one-half per cent. to surplus or pay 6 per cent. and carry 1 and one-half per cent. to surplus."

Seven and a half per cent. upon common stock is apparently what the Commission considers reasonable for a railroad to earn, but is the comparatively small margin of 1 and one-half per cent. to be assigned to surplus ample for that purpose, in view of the contingencies that are always liable to arise, seriously and unexpectedly drawing upon or entirely depleting such surplus? A notable instance of this sort occurred this Spring in the case of the Ohio floods.

A broader consideration must be given to these matters if the public confidence is to be retained and the credit of the railways regarded as ample to attract new investment. That this confidence needs stimulation is evidenced by the record of new securities listed for public acceptance. In 1909, the total of such securities was $2,424,482,585. Of this amount, railroad securities were $1,513,008,815, or 62.4 per cent. In 1912, all corporations issued $1,816,008,540, of which the steam railroads issued $345,787,000, leaving for other corporations $1,470,221,540. The percentage of railroad issues in 1912 was only 19 per cent. In 1909, the railway securities issued were $601,535,045 more than the securities of other corporations, while in 1912 the securities issued by corporations other than railroads was more than four times the amount of railroad securities. If the proportion of railroad securities in 1912 had been the same as in 1909, the amount would have been

Digitized by Google

$1,133,189,328, or three times more than was issued. From these results, it is apparent that corporations other than the railroads since 1909 have issued securities showing an increase, whereas the railroad issues have declined each year. The non-railroad issues in 1912 were $550,000,000 more than in 1909, while the railroad issues were $1,167,000,000 less.

Here we have the strongest indication of the public view of the attractiveness of these respective securities, as well as an indication of the impaired credit of the railways. This credit must be rehabilitated and maintained. The only business-like method in which this can be accomplished is in the same manner that would be applied to any other private or corporate enterprise, that is, adjust the charges for the service or product upon such a basis as will insure adequate interest returns, permit a reasonable profit and allow something additional for contingencies, which will prevent the impairment on closing down of the industry.

Summarizing the number of persons indicated above whose income is directly or indirectly dependent upon or affected by the railroad business, we have a formidable total, and the investments of institutions back of which are the securities of the railroads are shown to represent enormous amounts. In addition there is the independent question of facilities for the great army of shippers whose business welfare is daily dependent upon the uninterrupted operations of the railroads, and it is mainly for the purpose of meeting the growing demands of shippers and commerce and enlarging facilities generally that the present effort to secure adequate revenue for these expenditures has been made. It is estimated that millions of dollars are needed for the enlargement of terminals to meet the demands for the coming years. There is also an increasing and constant demand for additional equipment. In the mild winter of 1912, the net car shortage rose to 51,000, and the highest number of cars asked for and unavailable was 73,000. Had the winter been normally severe, a congestion disastrous to commerce would have ensued. It is admitted that all facilities have not grown as rapidly as the traffic.

The many phases of this problem are now receiving wide public attention and there are hopeful signs that the public is disposed to regard the situation with greater equanimity and less antagonism. The classes indicated herein are clearly and directly concerned in the pending questions. This they should recognize and do all they can to stimulate action for fair and full consideration of the changed conditions which apparently justify more adequate compensation to the carriers for their services. It may be reasonably hoped that the Commission will recognize these changed conditions, the possibility of which was anticipated in its decision in the Advanced Rate Case as follows:

> "We do not say that the railroads may not increase their incomes." . . . "We trust they may and confidently believe they will, but if the time does come when through changed conditions it may be shown that their fears are realized or are approaching realization, or when through a survey of the whole field of operations there is evidence of a movement which makes against the security and lasting value of legitimate investment and adequate return upon the value of these properties, this Commission will not hesitate to give its sanction to freight rate increases which will be reasonable."

The "evidence" is at hand in higher wages and the greater cost of operation and the necessity of affording greater facilities. This and the known impairment of the railways' credit would seem to afford all the "evidence of a movement" necessary to satisfy the conditional promise of the Commission.

Is it not quite within reason to expect that the same public regulative power which can now be employed to prescribe for the protection of *purchasers* of transportation the maximum charge they need pay, shall with equal concern in the interest of that great number who actually *own* the transportation plant, assure to them, such minimum charge for the output, as will maintain the plant in complete working order? Where these purchasers are dependent upon this plant for their material, physical, social, educational and practically every other condition pertaining to human comfort and welfare, should they not urge these considerations in behalf of maintaining the plant in the highest state of efficiency?

The following significant facts as to the operations of the railways in the United States for the year 1912, compiled by Mr. Slason Thompson, of Chicago, are given. That year resulted in:

The lowest average freight receipts since 1900;
The highest wages in their history;
The multiplication of costly regulations;
The heaviest loss and damage claims on record;
The highest taxes yet levied;
The largest gross revenue received;
The largest expense of operation paid.

The combined result of these developments was the lowest relative *net* income in 25 years. These are facts worth remembering by those who are concerned in the proposed advance in freight rates.

"JIMMY, DIDN'T I TELL YOU NOT TO WEAR THOSE LONG PANTS TODAY? GET RIGHT OUT OF THEM AND INTO THESE SHORT ONES! YOU ARE GOING TO TRAVEL FOR HALF FARE!"
"AW, MA!"

VACATION ECONOMIES
(Webster, in the Chicago *News*.)

President Willard's Address to the Officials of the Baltimore and Ohio

NEARLY three hundred railway officials of the Baltimore and Ohio attended the second staff meeting of that system held at Deer Park, Md., on September 22d and 23d. These included the officials and members of the operating, transportation, engineering and mechanical departments who are responsible for the operation and maintenance of the 3,500 miles of line of this great system. The meeting was arranged in order that there might be a general discussion of the affairs of the Baltimore and Ohio including its policies and its operating problems.

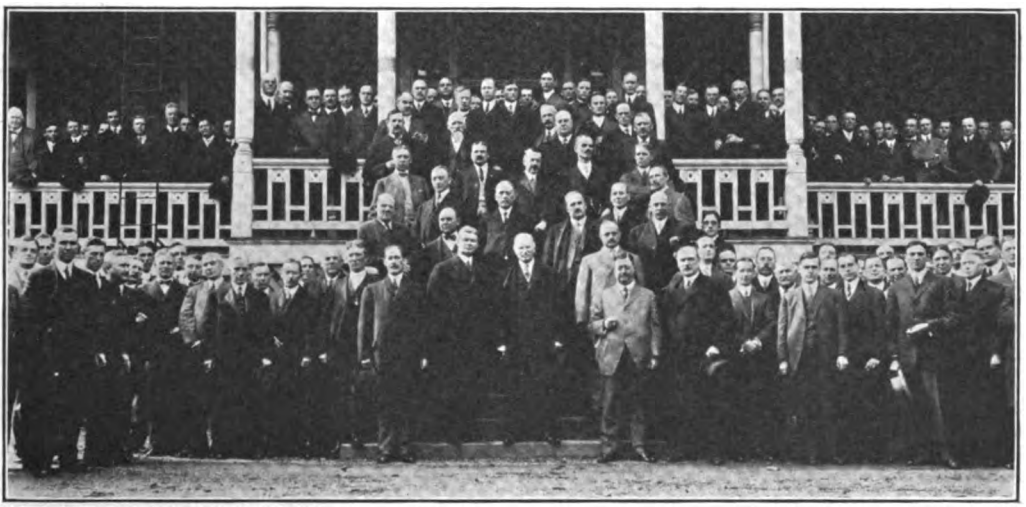
It was necessary to temporarily move the headquarters of the railroad to Deer Park for the two days in question on account of the attendance at the meeting of so many of the higher officials. President Willard was accompanied by his executive staff, including Vice-President A. W. Thompson, Chief Engineer Stuart and General Managers Galloway and Loree.

A few months after Mr. Willard became president of the Baltimore and Ohio and allied companies he called a meeting in order to confer with his fellow-officials as to the needs of the property and also to outline the policy of the management in its dealings with the general public. At that time Mr. Willard placed the needs as he saw them before the officials and told them what he considered should be done and the amount of money which should be spent in placing the road in position to handle its constantly increasing traffic and in equipping it for future development. The program outlined at that time was entered upon, so that the present meeting was called to discuss the railroad and its problems from the angle which it presents after the large expenditures have been made.

Since the staff meeting there has been expended in betterments on the Baltimore and Ohio system $100,000,000. Miles of new track have been constructed, mountains have been torn away to provide low grades, tunnels have been eliminated, safety appliances have been installed and hundreds of passenger cars and locomotives of all types as well as thousands of freight cars have been added to the service.

The most significant result of this large expenditure for new facilities is in the earnings of the Baltimore and Ohio Railroad for the last fiscal year, which were in excess of $101,000,000 gross, so that the president of the company outlined to his official family the plans for handling the enormous business which produces such revenue and defined questions of efficient and official service.

Vice-President Thompson presided at the meetings and introduced President Willard to the other officials. President Willard, in his opening remarks, stated that he was glad to see so many of the Baltimore and Ohio men who had attended three years ago, and that many of them are filling positions of increased responsibility, which he termed a fulfillment of the Baltimore and Ohio policy of promoting men. The president told the officials that he wanted each one to consider himself an assistant to the president, and that they would discuss matters intimately as between chief and assistant. Mr. Willard cast a retrospective glance at the Baltimore and Ohio of three years ago, before the program of improvements was undertaken, tracing step by step the expansion of the railroad's facilities, the growth of the company's business and the problems which have confronted the management, as well as the American railroads as a whole, during that time. Every phase of railroad operation came in for a part of the discussion—the question of credit and its relation to securing funds for improvements, public relations, economy and efficiency of operations were taken up.



GATHERING OF BALTIMORE AND OHIO OFFICIALS AT DEER PARK, MARYLAND. PRESIDENT WILLARD IS THE CENTRAL FIGURE OF THE LOWER ROW.

Digitized by Google

In referring to the improvements which have been made to the Baltimore and Ohio since the last meeting was held, Mr. Willard called attention to the fact that the company has spent some $40,000,000 in the betterment of the physical condition of the property, with about $10,000,000 under way and $47,000,00 in the purchase of new equipment, station improvements and other work which brings total expenditure close to $100,000,000. He further stated that, with favorable conditions obtaining, the hope of the management is to continue this program at the rate of $15,000,000 annually for the next five years, provided that larger expenditures might be made if conditions justified.

Pointing to the benefits of the improvements which have been made, the chief executive said that the road is in such shape now that a train running between Chicago and the Atlantic seaboard can be operated with an economy which compares favorably with the performance of other lines and over a route of easy grades. In taking up what properly may be termed the railroad question, Mr. Willard told his audience of the new problems constantly coming before the railroads for solution, entailing large expenditures of funds, the increases in wage which have been granted the railroad employes under agreements and by arbitration proceedings, the added burdens of legislative enactments, higher taxes and greater costs of materials and supplies of all kinds.

Applying the wage increases to the Baltimore and Ohio, Mr. Willard said that the result of such movements during the past three years has brought about a condition to-day where the pay is approximately $5,000,000 a year greater, the number of employes being equal, than three years ago, and this, he said, did not take into consideration the demands of the conductors and trainmen now being settled by arbitration. Taxes, he said, increased about $740,000 last year, and that this year they would likely increase $1,000,000. This meant that there would be an increase of $10,000,000 in expenses before any consideration could be given to the application of net earnings to interest requirements. This increase in expenses was wholly independent of the rights of stockholders.

Mr. Willard stated that the stock of the Baltimore and Ohio Company to-day represents an investment of 100 cents on every dollar. Drawing a parallel between the railroads and other business enterprises, the speaker compared the rate of interest obtainable through investment in industrial and manufacturing securities and pointed to the fact that the railroads, in order to retain their position in the eyes of the investing public, must bear evidence of the stability of their securities from an investment standpoint.

In defining policy of the Baltimore and Ohio on the question of dividend and rates of interest, the president said the policy is not one of striving to increase the dividend rate above 6 per cent, but that any margin increase of surplus above this amount is returned to the property in the form of betterments. With such a situation prevailing it was stated that the plan would be to increase maintenance expenditures by providing heavy rail, putting in stone ballast, making station improvements, etc.

Summing up the railroad situation, Mr. Willard stated as his belief that the hope of the railroads for the future is to be found through an increase of rates for services performed, and acting on this belief the Eastern railroads have applied to the Interstate Commerce Commission for permission to make a horizontal raise of five per cent in existing rates, which action was taken in view of a decision handed down by the Commission. Stating that he had every confidence in the outcome of the matter, Mr. Willard told his auditors that if for any reason there should be a failure on the part of the Government authorities to grant the increase, the railroads would be in exactly the same position as the head of a household desiring to make improvements, but lacking sufficient funds. It would mean, figuratively, that instead of putting on a new roof the leak would be patched and instead of renewing the fence the pickets would be repaired.

Taking up another phase of the railroad question, Mr. Willard spoke of the close community of interest which should exist between a railroad system and its patrons, the railroads being a semi-public institution from which the public has the right to demand and receive satisfactory service and which, in turn, has the right to expect fair treatment from the people. He also touched upon the importance of strict discipline being maintained in the transportation organizations, both in the interest of the public and the company.

"When I was running an engine the importance of strict discipline was recognized," he said, "I realized it as trainmaster and superintendent and my whole experience since convinced me of its paramount importance."

He impressed upon his fellow-officials the importance of treating all employes in the service in the light of absolute fairness and justice and this he believed insures the greatest efficiency of operation.

The president stated that efficiency means economy. Efficiency in the operation of trains and the handling of tonnage means reduced cost of transportation, and in this connection he pointed to the rise in the average train loading on the Baltimore and Ohio system, which to-day averages 680 tons, or an increase of 50 per cent in three years. Economy in the use of material and supplies also means efficiency and such apparently trivial items as the saving of a single shovelful of coal by a locomotive fireman on each mile run would mean a large saving to the company in its fuel bills.

In closing his address Mr. Willard told the officials that he expected their strongest co-operation in having the Baltimore and Ohio system regarded as safe to travel over, prompt to ship over and in having the public understand that the management wants the communities it serves regard the company as a friend of the patrons at all times and also to work toward such ends that the investing public will look upon the property as offering the possibilities of sound investment.

A reception by the president and other officers of the different departments was held at the close of the meeting.

At the opening session of the second day the principal address was delivered by Vice-President Thompson, followed by General Manager Galloway, of the Baltimore and Ohio, and General Manager Loree, of the Baltimore and Ohio Southwestern, Cincinnati, Hamilton and Dayton lines. A number of other addresses were made by officials, who took up various questions of operation.

Increased Rates and Facilities Essential to National Prosperity*

By B. A. WORTHINGTON,
PRESIDENT, CHICAGO AND ALTON RAILROAD.

NO better evidence of the decline in railroad prosperity can be adduced than the comparative composite statement of the income accounts of a number of important common carriers in the state of Illinois, including the Wabash, the Chicago and Eastern Illinois, the Big Four, the Illinois Central, the Chicago, Peoria and St. Louis, the Toledo, Peoria and Western, the Lake Erie and Western, the Toledo, St. Louis and Western, the Cincinnati, Hamilton and Dayton, the Vandalia, the Peoria and Eastern, the Chicago, Terre Haute and South Eastern, the Chicago, Indiana and Southern, and the Chicago and Alton, fourteen railroad systems invaluable to commerce as agencies of concentration and distribution, particularly to the state of Illinois, more particularly to the Central Manufacturing District of Chicago.

	Fiscal Years. 1908.	1913.	
Opr. Rev.	$160,664,617	$206,172,785	*28.3%
Opr. Exps.	118,257,987	162,078,777	*37.0%
Net Opr. Rev.	42,406,630	44,094,008	*4.0%
Opr. Ratio	73.6%	78.6%	
Taxes	$5,705,564	$7,940,289	*29.1%
Net Cor. Inc.	10,843,704	4,753,493	†56.2%

*Increase. †Decrease.

The year 1908 was a panic year. The year 1907 and other years prior to 1908 were better than 1908.

Net after taxes in 1912 and 1913 were smaller than in any previous years.

Taxes increased $1,000,000 from 1911 to 1913.

Net corporate income, after deductions, shows that these fourteen railroads had $16,155,624 to apply to dividends in 1910; only $4,193,877 in 1912; and only $4,753,493 in 1913.

Net corporate income shows a decrease of 56.2 per cent since 1908; in other words, decreasing twice as rapidly as total operating revenues are increasing; i. e.—

Total operating revenues increased 28.3 per cent.

Net corporate income decreased 56.2 per cent.

Deductions from income have increased due to an increase of almost $130,000,000 in new capital put into additions and betterments, and to the increase in rates of interest which the railroads have to pay.

FALLACY OF THE GROSS EARNINGS THEORY AS A MEASURE OF RAILROAD PROSPERITY.

In dealing with the matter of railroad regulation, more particularly with the matter of rate limitations, it is customary with commissions and legislatures to attach marked significance to the continually increasing gross earnings of the railroads, the inference being that gross earnings constitute a fairly reliable index to the financial results of operation.

Not only is this theory entirely wrong, but the premises upon which it is based are unsound. Not only has revenue per unit of service decreased very rapidly in recent years, but expenses have increased in even greater ratio—a two-edged sword that destroys the theory of gross earnings representing an accurate barometer of railroad prosperity.

To illustrate concretely what this means in dollars and cents, I have only to cite the current earnings of three of the greatest railroad systems in the world—the New York Central Lines, the Pennsylvania System, and the Southern Pacific Company.

The July statement of earnings and expenses of the New York Central Lines, recently published, shows:

Total Operating Revenues	*$2,328,988	—10%
Total Operating Expenses	*3,239,970	—19%
Net Operating Revenues	†910,982	—15%

*Increase. †Decrease.

For the same month the Pennsylvania System published the following statement:

Total Operating Revenues	*$1,995,053	— 6%
Total Operating Exp. & Taxes	*2,727,745	—19%
Net Operating Income	†732,745	— 8%

*Increase. †Decrease.

And the Southern Pacific Company reports:

Gross Revenue	†$1,380	—1.100%
Oper. Exp. & Taxes	*784,803	— 14%
Rev. Over Exp. & Taxes	†786,183	— 19%

*Increase. †Decrease.

Here are two instances wherein total operating revenues increased very substantially, but net decreased in a much greater ratio; in the latter instance, with approximately the same gross revenue, an alarming decrease in net after deducting operating expenses and taxes, is shown.

I call your particular attention to the fact that these are the *current* results of operation of three of the foremost and most progressive railroads in America, at the present time enjoying the heaviest volume of traffic in their histories. And, incidentally, I venture the question—what can be expected of weaker lines? And what may be expected of even these strong lines themselves in a period of adversity which is sure to come and which, in its very nature, will take away the remedy now at hand?

While these figures in themselves are convincing that gross earnings do not constitute a reliable index to the financial results of operation of railroad properties, as you are aware they do *not* include fixed charges; the higher rates of interest now demanded on railroad bonds and notes; and the prohibitive rates for new capital necessary for improvements to handle economically the volume of traffic that is now moving, and the prospective traffic of the future, are factors which will influence the results of operation for years to come.

*From a recent address before the Central Manufacturing District Club of Chicago.

Digitized by Google

How Depression Would Still Further Affect the Results of Operation.

You will remember the panic year of 1908, following the exceptionally prosperous business year of 1907; and as business depression is likely to come upon us at any time in this country under present business methods, it occurred to me that it might be interesting for you to note what would have been the effect, had the year 1913, following the fairly good business year 1912, suffered a business depression corresponding with the depression of 1908. By applying to the results of operation in the year 1912, the same ratios of decrease as in 1908 compared with 1907, eleven important railroads operating in the Central West would show the following decreases in 1913:

Total Operating Revenue	†$28,091,581	— 5.2%
Total Operating Expenses	†6,992,276	— 1.8%
Net Operating Revenue	†21,099,305	—34.6%

*Increase. †Decrease.

Considering the railroads included in the foregoing comparison individually, four of the lines would show deficits in net corporate income ranging from $300,000 to $3,850,000; three of the lines would show comparatively small margins of surplus under net corporate income, ranging from $336,000 to $682,000; there being only four of the larger and stronger railways systems that would be able to maintain a sufficient surplus to insure stable financial conditions, even during a depression of one year's duration, and a continuation of such adverse conditions would no doubt produce more disastrous results.

This takes no account of the continually increasing taxes and fixed charges; nor is there any substantial assurance at hand that a recurrence of the 1907 panic is impossible or even improbable. Apparently we have averted a panic this fall—or, have we only postponed it after all? Have we been treating the *cause* of the trouble, or only a *symptom?* Have we eradicated the cancer or have we only chloroformed the patient?

Time will tell—time is telling.

It is extremely urgent that commerce should recognize these conditions and display some activity to relieve the situation. Kind words of sympathy are not out of place at a funeral, but sympathy is a poor substitute for nourishment; and what the railroads need now *is* nourishment in the shape of increased freight rates and it is up to the manufacturing interests of Chicago, as a matter of self-defense, to take the lead in fighting for this cause.

Hasty and Ill-considered Legislation.

The disregard and contempt displayed by the makers of our laws for the knowledge and experience of thousands of trained experts in railroad matters, and the extravagant recklessness and utter foolishness in tampering with the most delicate and evenly balanced machinery of commerce, are serious matters which call for prompt and heroic treatment, and nothing can be as effective as a serious, conscientious and persistent protest on the part of the shipping interests of the Central Manufacturing District. With knowledge and experience, even actual necessities so liberally discounted in legislative matters, the railroads themselves are at the mercy of an unsympathetic public, bound and gagged with legislation and plucked to a finish by the harpies of politics.

Interests of the Railroads and Industries Interdependent.

In this connection it might be well to look back to the early days of railroading—wherever we may look we find the railroads nursing industry, defending industry with every means at its command—lawful or unlawful, the *railroads defended industry,* for the railroads always have recognized that industry is indispensable to successful railroad operation. In many instances, we find that the railroads donated building sites, and transported building materials, either free of charge or at a nominal cost. The old-time rate wars, destructive to the railroads themselves, were sacrifices to industry.

The acute business instincts which prompted the railroads to accept the dangers incident to their pioneering work of development, were always sounding the future. The railroads anchored their lines with industries and pushed on farther and farther into the wilderness, always looking to the future for reward. Profits, so called, lay far beyond the span of life of the great men who undertook this hazardous work in the interest of civilization; they responded to a mightier cause, and bequeathed to us the legacy of their efforts—the railroads and the industries which the railroads have encouraged and protected always—the elements of peace, happiness and contentment.

However, changed business conditions have come about—purely and simply through the efforts of the railroads to protect industry.

Discrimination, manifestly an unfair instrument of protection but a perfectly natural weapon in the early pioneering days, has been condemned; discretion is indicted and held as an accomplice. The fine economic poise of commercial conditions, ever changing and shifting to meet the varying needs of industry, hitherto has been established automatically by freight rates which maintained more or less definitely a perfectly natural balance in commercial relations. In the nature of things this compensating influence, the most delicate and perfect, withal the most potent regulating influence, cannot be fixed permanently and arbitrarily without immediately disrupting and finally wrecking the entire machinery of commerce itself. We are straining here and there, some pieces of this vast machinery already broken, and it is the sheerest nonsense imaginable to further withhold the relief that is now within our hands. A recurrence of the panicky conditions of 1907 or a serious stringency in the money market under present conditions, without doubt, would remove the remedy forever.

Rate Adjustments Should be Made to Meet the Conditions of Commerce.

The right to adjust rates to meet the conditions of commerce is an inherent right with the railroads, automatic and self-adjusting in every respect. Denying the railroads the right to adjust rates, except on a downward scale, is pernicious and destructive; it wholly disarms the railroads of defensive measures, either for itself or for industry, which is one and the same thing, and we have now arrived at the point where industry should protest, with all the vigor and insistency of which it is capable,—not only in rec-

Digitized by Google

ognition of services performed in the past, but in recognition of the requirements of the future.

The serious predicament in which the railroads now find themselves, is due entirely to the defensive measures which they adopted to *protect* commerce. All the talk we hear about "extortion" on the part of the railroads is merely the modern version of "the world am flat and the sun do move" theory. It has no place in the ethics of railroading, as any one at all familiar with the situation well knows, wholly incompatible with the theory of rate-making or the upbuilding of industry. The present rate structure is wholly a natural evolution along economic lines, and the less interference we interject into the situation by legislative means, the better it will be for all concerned.

With the public clamoring for steel passenger train equipment, the Government heading the procession with mandatory orders for steel postal cars regardless of everything else; the public still further demanding new, elaborate and exceedingly expensive passenger stations, not only at Chicago and Kansas City, but at many other points, none of which means additional revenue—only additional expense; the public also demanding and enforcing the elimination of grade crossings, and innumerable useless and impracticable "improvements"—it is a plain case of "money down and hands up" inconsistent with either justice or common sense.

Other Regulations of the Postoffice Department.

By the installation of the parcel post system by the Government, followed by heavy reductions in express rates, the earnings of the railroads from this source are seriously affected—first by taking away from the express companies a traffic upon which the railroads received a portion of the earnings; in the second instance, the very marked reduction in express rates affects the railroads to about the same extent that it affects the express companies, under the contract relations which exist between the railroads and the express companies and while the railroads previously were not receiving a fair compensation for postal services, they were compelled to accept the additional burden of the parcel post system, at wholly unremunerative rates, the maximum increase being less than five per cent of the allowance before the parcel post system was inaugurated.

Meantime taxes are increasing, labor organizations are pressing their claims persistently, and all expenses incident to operation are advancing.

Railroad Bonds Should be as Safe as Government Bonds.

Measured by the hazards undertaken and the industrial development induced, railroad securities should be free from disturbing influences of this kind. By all means railroad bonds should be as safe investment as Government bonds, for the physical property of the railroads constitutes the underlying value of Government bonds. It is a parody on business methods to tamper with a security of this kind. Withdraw the railroads, and all that railroads imply, and Government bonds would represent an entirely fictitious value, a wealth of the nation that would be wealth unavailable. And to the extent that these artificial measures are restricting railroad development, we *are* withdrawing the railroads as a tangible security of national prosperity.

Railroad Stocks Should be Free from Unnatural Influences.

In 1910, 33.29 per cent of the stocks of railroads operated in the United States had never paid a dividend, yet these railroads are invaluable to the thousands upon thousands of persons they serve. Surely there is no sound reason for making the conditions of operation so onerous and burdensome as to crowd out many of these lines serving territory where traffic is light. Every one of these lines should be protected, should be enabled to maintain the physical condition of such property at a high standard of efficiency, yield to capital invested in such stocks a fair return commensurate with the hazards undertaken and development created, and, further, to provide from operation a surplus to guard against reverses of the future.

Railroad stocks, however, are delivered by legislative enactment to the tender mercies of the pirates of labor and the sharks of finance—merely weather vanes of speculative sentiment, responding to the hot breath of summer and the cold blasts of winter. Railroad capital is reduced to a beggar at the doors of justice.

All this is arbitrary, unnatural and fraught with grave dangers. With reasonable rates for service performed (which is all that is asked, and all that is wanted), railroad property could be maintained at a high standard of efficiency, railroad securities no longer would be financial traps in the hands of wily speculators, but savings banks—anchors of the nation, and the impetus to industry that would be afforded by permitting the railroads to supply current necessities, would be nothing short of wonderful.

A Notable Gathering.—On September 27th, Mr. M. C. Kennedy, president of the Cumberland Valley Railroad, entertained at his summer home near Chambersburg, Pa., prominent officials of Eastern railroads, the Governor, ex-Governors, United States Senators, Congressmen, members of the Supreme Court, captains of industry and many professional men from the cities of Pennsylvania. These gatherings have been held for the last twelve years.

Among those present representing the Pennsylvania Railroad were: President Samuel Rea; Vice-Presidents W. W. Atterbury, George D. Dixon, Henry Tatnall, W. Heyward Myers; Secretary Lewis Neilson; Treasurer James F. Fahnestock, and Executive Assistant Ivy L. Lee. The Pennsylvania Lines West of Pittsburgh were represented by Vice-Presidents E. B. Taylor, D. T. McCabe, and G. L. Peck, and there were also present, President George W. Stevens, of the Chesapeake and Ohio Railroad; President J. M. Fitzgerald, Western Maryland Railroad; President L. E. Johnson, Western Maryland Railroad; Oscar G. Murray, chairman of the Board and President Daniel Willard, of the Baltimore and Ohio; President W. H. Truesdale, Delaware, Lackawanna & Western Railroad; President W. T. Noonan, Buffalo, Rochester & Pittsburgh Railway; Vice-Presidents Theodore Voorhees and A. T. Dice, of the Philadelphia and Reading Railroad, besides many prominent Philadelphians.

"In the Midst of Life": A Statistical Story

By J. H. ROCKWELL.

IN a report recently submitted to Congress, the Inter-state Commerce Commission, in its discussion of disasters on American railroads, points out the fact that more than sixty-three per cent of all the accidents investigated during the past year, were caused by the blunders of employes.

From July 1, 1912, to June 30, 1913, the railroads of this country killed 10,585 persons and injured 169,538. These figures show an increase over the year 1911-1912, of 189 killed, and 19,379 injured, 16,386 were passengers, 143, 442 employes, in the current year, 318 were passengers, 3,685 employes and 6,632 other persons, indicating an increase of thirty-three in the total number of employes killed, a decrease of thirty-eight in the total number of passengers killed, and an increase of 194 in the total number of persons killed other than passengers and employes. Of the persons injured, 16,386 were passengers, 143,442 employes, and 10,710 persons other than passengers and employes.

It was the annual slaughter of railroad men. The number has been increasing every year, and apparently there is no way of mitigating the deadliness of railway operation. Safety devices have failed to help much. In any event, you cannot make a 150-ton engine and a string of heavy cars "foolproof." And just there lies the trouble.

The employes are good enough men—most of them thoroughly experienced in their work—but they are inclined to "take chances." So the list of the dead and the injured lengthens yearly, because of heedlessness and hurry; they swing on and off the cars in motion when there is no remotest need of it; they crawl under cars without notifying an equally careless engineer of their intention, and an instant later they are worked up into red waste under the wheels of the train; and these are only a very few of the "chances" taken by these men almost hourly in the yards, on the trains and along the tracks of every great railway system of the country.

But railway officials are waking up. More than a year ago the Northwestern took up the matter of trying to keep their men from committing harikari under engine trucks and car wheels. The Frisco was the second road to fall into line and was closely followed by the Santa Fe and the Baltimore & Ohio; now almost every road of importance in the country, is concerning itself in this attempt to curb the foolhardiness of its employes. Every man, boy, veteran and apprentice in the shops and on the road, in the roundhouses and on the sections, has been told about his carelessness and what it costs in life and property, and is also given to understand that if persisted in, his carelessness will cost him his job.

It is the little things that are killing the men who run the engines and work in the yards and on the trains, and in the shops; and this the railway companies are also telling their men. Here are some examples furnished by the claims department of one of the great railways of the West:

Down at Cape Girardeau, Missouri, the Frisco road has a little turn-table installed in a roundhouse. Someone about the roundhouse fixed a stick with a nail in the end of it, to be used in hoisting the night light over the track running out on the "table." After the happy-go-lucky fashion that obtained there, the man who lit and hoisted the light, always threw down the stick on the deck of the "turn-table." It so happened that a hostler jumped down from the running-board of an engine one night, lit on the stick and rolled on over the deck into the pit beneath, breaking both wrists and otherwise damaging himself. This cost the railroad considerable money and practically disabled the employe for life. But the cases are legion. At Garfield, another Missouri town, an accident ocurred a few months ago, that resulted from "over-caution" thoughtlessly applied. The night operator set his red light against an oncoming pasenger train for which he had orders. To make doubly sure that the train stopped, he told his helper to step out and place a torpedo on the track.

The young man did so. He placed it exactly in front of the station platform, instead of walking a few yards down the track. A curious youth lounging around on the platform when the train pulled in was struck by a piece of the torpedo when it exploded and seriously injured. The injured young man, of course, demanded damages.

In Marshfield, Illinois, a careless baggageman left a truckload of cases containing empty soda-water bottles too near the track. There was a crowd of people on the platform waiting for a local passenger train laying in the yards until a limited passed through. When the limited came along the mail clerk reached out with a big crane for the mail sack hanging on a rack above the station platform. The crane ripped into the truckload of bottles, threw them in a welter and haze of broken glass, all over the platform. Two waiting passengers were struck by flying cases and very nearly killed.

For the purpose of showing train-men, and the general public, the dangers that lie in thoughtlessness, the management of the Frisco road had a number of photographs made exhibiting the dangers, of this character, as they occur almost every day.

The foolhardy brakeman who plays with death while adjusting a coupling, is given to see the foolishness of his actions. The switchman who swings himself through a string of cars while they are in motion, is pictured. The carelessly "kicked" car that goes rolling down over a grade crossing is shown about to smash an automobile with three or four persons in it. The brakeman who insists on standing between the bumpers of two cars while adjusting the couplings, is shown just how easily death may come to him.

"Railroad men," says an official of one of the largest railway systems in the West, "are inclined to be fatalists. They think they will be killed when their time comes, and not before, and hence their willingness to "take a chance." When they see a man cut into strings under a train, they do not think for a moment they will figure in such an accident. It is very much like the soldier who goes into battle secure in the belief that he will not be killed, even though half his company is certain to be wiped out.

"The whole purpose of this safety movement of ours, is to bring home to the men that they must

Digitized by Google

help themselves. The statistics issued by the Inter-state Commerce Commission for 1912 show that 73.5 per cent. of all accidents to employes are caused by their own fault. The other 26.5 per cent. come from those causes that may be traced to some fault of the company. I was talking with one of the oldest engineers in the service, about this, and he admitted that the percentages were true."

At regular intervals there is a special train sent out by the roads that have adopted the safety idea, and on this train is a local safety committee. They are looking for instances of carelessness all over the division. At one station they may find a hole in the platform sufficient to throw a person down and injure him. At another station the stock-chute gates are open wide enough to rake a trainman off the side of a car and kill or cripple him for life. They see everything. Habitual carelessness that may result in a death some day, is remedied. The road pays the bills of the trip and the committee has the satisfaction of knowing that they have probably saved a few lives.

There is one thing that the public does not seem to understand, and that is that there is something more to railroading than the running of trains. There are deaths everywhere. Not long ago a car-tink out at Pittsburg, Kansas, crawled under a string of cars to fix the draw-gear of a number of them. It is a rule of every company—dictated by common sense—that the car repairer must put out a blue flag on the car on which he is working. If he does not he is apt to be ground into little pieces under the wheels of his car when a switch engine bumps into it, as it is likely to do any moment. The "car-tink" at Pittsburg failed to put up a blue flag and had both legs cut off in less than ten minutes after he went under the car.

It is quite true that "familiarity breeds contempt," even when applied to danger. After a man has crawled over and under flat cars, and box cars, and passenger cars, and gondolas, and cabooses for a few years without meeting with a mishap, he gets into the habit of taking chances and when he begins to do that he becomes more and more careless. One of these days he is brought into the division terminal with a part of his anatomy missing.

In the old "link-and-pin" days you could tell a railroad man at sight, and a good way off. He was usually short from one to half a dozen fingers, for in spite of every thing, the links and pins would nip them off. When the patent coupler was adopted, it was thought that the troubles of the brakeman were over. But he at once set about finding new ways of killing and crippling himself.

The number of passengers killed by railroads is steadily decreasing, while the number of employes killed is just as steadily increasing. The roads were confronted by a peculiar situation. They do not want to lose their best men—their really most efficient men. Here is an example of how even a veteran is apt to lose his life, and it can be duplicated a dozen times on any road in the country.

On October 28, 1912, a Frisco conductor gave his head brakeman a switch list. One car was kicked onto a passenger track and the brakeman in question threw the switch for the adjoining track, and turned the "derail." The car was cut off and the "go-ahead" signal was given. The next car was to be kicked back down the main line to the caboose. The brakeman walked along opposite the space between the last two cars as the engine and eleven cars moved out of the siding.

While the train was moving at a rate of about four miles an hour, he stepped in between the last two cars and gave the "go-ahead" signal with his left hand to the fireman. As the fireman looked back he saw the brakeman fall out from between the cars. An emergency stop was made and the crew ran back to find that both his legs had been cut off above the knee. He died within an hour. He had gone between the cars to close an angle cock, so that when the cars were kicked down the main line they would not stop when the air hose connection was broken. As he stepped between the moving cars he stumbled over the "derailer" that he, himself had turned only a moment before. Being given the switch list shows that he was considered a capable man, but he was probably in a hurry and took a chance, and, practically, committed suicide.

At Newburg, Missouri, a brakeman was killed in much the same way. He thoughtlessly walked between two cars to adjust the couplers at the exact moment the engineer decided to back up half a car length. As a result, the brakeman was caught squarely between the two draw-heads and was quite dead when they took him out.

Trainmen go to their death almost daily, knowing that they are doing the things they are forbidden to do by the rules and regulations of the road. They will go out of the station now and again, with hardly enough water in the engine boiler to get them clear of the yards. Six engines have been blown up on one road, in as many years, on account of the carelessness of roundhouse men and engineers, and in nearly every instance, the engineer and fireman have been killed.

It is these little acts of thoughtlessness that runs up the death list of railway employes. They become so accustomed to taking chances that it soon gets to be a habit, and they give the matter absolutely no thought whatever. This can be seen in the way they run their trains and do their work in the yards, and in the roundhouses. And they are a good deal more careless, it seems about their own safety, than they are about the safety of others. A study of the Inter-state Commerce Commission figures for the current year—or any year—will show this to be true. It is the heedlessness of the individual that hurts, and it is nearly always he that pays the penalty of his folly.

It is too often the case, however, that the passenger suffers instead of the offender, as in the instances cited of the exploded torpedo, and the flying soda-water crates. Another accident of this sort occurred near Kansas City. The station agent left five loaded baggage trucks standing on a platform between two tracks, and it was necessary for the passengers from one train to cross this platform, and the track beyond, in order to reach the depot. The tongues of the trucks, instead of being hung up to the fronts of the trucks, were left resting on the platform, a distinct violation of the rules governing the matter.

A woman got off a train coming up from the south; she carried a baby in one arm, and a suit case and a bundle with the other. It was in the

Digitized by Google

night and the platform was dark. As she started for the station lights, some considerable distance from the platform, she tripped over one of the truck tongues and fell, seriously injuring both herself and the child she was carrying. It is such accidents as this that cause claim agents to very nearly use cuss words and demand somebody's head.

The examples we have given are only a very few of the more common cases of carelessness—or thoughtlessness—that lie back of almost two-thirds of all the railroad accidents investigated by the Inter-state Commerce Commission, and could be multiplied many times by claim agents in every part of the country. Of the other causes of railroad disaster many are shown to be due to defective equipment, bad roadway and excessive speed. Out of a total of 8,215 derailments, during the past year, 1,877 were caused by defects of roadway, and 3,847 were due to bad equipment, an increase over the previous year of 652 derailments due to bad roadway, and 1,023 due to bad equipment.

Excessive speed, although no exact percentage is given, has been responsible for a considerable number of train accidents, so largely so that the Commission declares that "conditions of safe operation are often ignored in the effort to bring fast trains in on time. This is a bad habit," it adds, "for which the traveling public is largely responsible. . . . Adequate measures should be taken to compel low speed wherever conditions require it, whether schedules are maintained or not."

What the railroads are trying to do more particularly, however, is to show the "car-tink" that he owes it to himself to put out a blue flag when he crawls under a car; to impress upon the brakeman the fact that he can couple a car without adjusting the coupler with his foot while the cars are moving, and show the switchman the utter folly of hazarding the interests of himself, the road and his family by rollicking over and around, and under, and along the tops of gondolas, refrigerators and cattle trains, and to point out to engineers and conductors that carefulness and forethought, and a strict obedience to orders, is the price of safety.

Peril on the Railway*

By JAMES O. FAGAN.

TO the public, face to face with the details of the latest collision on the New Haven road, explanations and theories must now seem little better than insults. The unpardonable, inexcusable railroad collision is such a threadbare subject for discussion. A thousand times the thing has been riddled with investigation, and perforated ineffectually with "probes to the bottom." Yesterday a friend on the street fairly hissed in my ear these terrible question marks: "Bridgeport? Westport? Corning? Stamford? North Haven?" I could not answer him. Opinions and arguments are so much wind. The horror itself is the only indisputable fact in the situation. This much, however, in a general way, we do know: In this bountifully favored section of the United States, where sympathy for all classes of workers is keenest and kindest, where brains are brightest, where social and industrial aspirations are bravest, these avoidable operating disgraces seem to be the distinctive contribution of railroad men to the exchequer of human progress.

Sorrow and indignation very naturally accompany a distressing situation of this kind. Specifically for railroad men it is indeed a shameful state of affairs. While contributing causes are doubtless many and powerful, the indictment itself is flawless. For wreck solutions and safety matters in general are, first of all, problems for railroad men. The public understands very little about such matters. Railroad men, from train men to managers, are engaged in a technically strange business. To the people their operating language is a foreign tongue. They work by means of signs, codes and schedules. To the average outsider their tools and equipment are so many figures of speech. Consequently travelers who go out on the rails in coaches are absolutely at their mercy. It is well, then, that they, managers and employes, should take these collisions intensely and humanly to heart. I say there is shame as well as sorrow in the situation for them, God willing, "tears, perhaps for blood."

In the past, at any rate, the people have given this railroad world of which I speak a free hand. On the whole, constructively and humanly, as times and manners go, public confidence in the railroads has been well placed. Abuses of all kinds are giving way to the pressure of public opinion. In fact the only public abuse on railroads that seems still to thrive amid the general uplift is this horrible leak in the safety department. For the discovery and stoppage of leaks in the railroad service investigations are at all times rightfully in order. Every form and degree of probe known to constituted authority has in this way from time to time been brought into service. The investigators have been coroners, public utility bodies in various states, and the Interstate Commerce Commission. Confining myself to the trouble on the New Haven Railroad, I think I am right in saying that the people have been led to believe from the various verdicts and findings of these investigators that the leak in the safety department of this particular railroad is in the main of a mechanical or financial nature. Specifically the reports and findings of the Interstate Commerce Commission have conveyed to the people the impression that train collisions on the New Haven can be accounted for not exactly in terms of faulty equipment, but of equipment that might, could, or should be improved upon. If space and emphasis in these reports mean anything, the public is justified in thinking that remedies and improvements are to be worked out fundamentally along these mechanical lines. The sooner this erroneous impression is headed off and stamped out, the better for the traveling public.

As a matter of fact, every man who works or who ever has worked on a railroad knows in his heart and can tell these investigators that, absolutely regardless of the nature of the equipment, there has been one startling and all-important feature common to one and all of the wrecks we

*Published in the New York Times.

A Comparison Between Capitalization and Cost of American Railways

By SLASON THOMPSON
DIRECTOR, BUREAU OF RAILWAY NEWS & STATISTICS.

WHAT about overcapitalization?" "What about watered stock?" and "What about exorbitant dividends?" are the current questions with which every plea for a fair deal to American railways is met.

248,888 miles of operated line:	
Total capital stock and funded debt	$19,694,987,553
Capital stock and funded debt owned by roads	5,037,442,484
Net capital	$14,657,545,009
Per mile of line owned (238,300 miles)	$61.508
Per mile of track owned (341,782 miles)	41,204

Is this overcapitalization? Compare the figures per mile with those of European railways.

Perhaps the skeptical reader may question the propriety of deducting $5,037,442,484 for the stocks and bonds in the railway treasuries. Well these stocks and bonds were paid for out of the total issue of securities, and in the year 1912 the roads reporting to this Bureau received no less than $257,121,010 from other income, nearly all of which came from these stocks and bonds. This is over 5 per cent. on the securities owned.

Perhaps the reader is skeptical about the returns to this Bureau. Well in 1911 the Interstate Commerce Commission reported that $308,881,892 "other income" had been received by all the operating roads, and in 1910, $252,219,946 was received from "other income," over 80 per cent. of which was dividends and interest on securities "owned or controlled.'"

So the overcapitalization and watered stock bogeys are relegated to the limbo of falsehoods to which demagogues chiefly resort for their so-called facts.

ACTUAL DIVIDENDS.

And now what about the exorbitant dividends?

The 386 roads reporting to this Bureau operating 236,444 miles in 1912 had $7,016,703,076 capital stock and owned $3,136,345,433 caiptal stock in operating and leased roads. The revenues from operation of these roads amounted to $2,806,177,194, the largest in their history. After paying operating expenses, taxes, rent of road interest, reserves for depreciation and betterments, deficits of weak companies which amounted to $32,986,563, and miscellaneous deductions, all they had left of these enormous receipts for dividends or anything else was $60,314,175.

But these 386 roads did pay $246,621,701 dividends on common and preferred stock.

How did they manage it?

Why out of the $257,121,010 "other income," mostly from the $3,136,345,433 railway capital stock owned by them. They simply paid dividends out of dividends received.

As a matter of fact the net dividends paid out of operating revenues and rental of leased lines in 1912 did not amount to $200,000,000.

The total interest and dividend charge on the operating revenues of the railways of the United States in 1912 did not amount to $500,000,000, which is only 3.42 per cent. on their net capitalization.

NET CAPITALIZATION IN 1912.

Following the formula adopted by Prof. Henry C. Adams when official statistician for the Commission to ascertain the only capitalization that "measures the claim of railway securities of railway revenues," the returns to this Bureau from 236,444 miles of operated line (196,831 owned and 39,613 leased) yield the following result for the year ended June 30, 1912:

SUMMARY SHOWING CAPITALIZATION OF 386 COMPANIES OPERATING 236,444 MILES OF LINE FOR THE YEAR ENDED JUNE 30, 1912.

Item—	Capitalization (196,831 Miles Owned) 1912	Capitalization (236,444 Miles Operated)
Capital stock	$7,016,703,076	
Funded debt	9,588,164,232	
Receivers' certificates	8,835,913	
		$16,633,703,221
Rental 39,613 miles, at 5%	$130,023,906	2,600,478,140
Total		$19,234,481,361
Less—		
Deductions for railway stock owned	$3,136,345,433	
Deduction for funded debt owned	1,901,097,051	
		$5,037,442,484
Net capitalization, 1912 (236,444 miles)		$14,196,738,877
Net capitalization per mile operated		60,043

Besides the railway stocks and bonds reported as owned by the companies included in this statement on June 30, 1912, they owned $678,060,706 stocks and $198,878,377 bonds other than railway issues and $154,312,034 miscellaneous securities. The income from these $1,027,251,117 securities, amounting to over $35,000,000, relieved railway revenues of just so much of their capital charge.

NET CAPITALIZATION OF ALL RAILWAYS 1912.

Accepting $14,196,738,877 as the net capitalization of the 236,444 miles of line reporting to this Bureau it only remains to place a reasonable estimate on the 12,444 miles not covered by such reports in order to arrive at a close approximation of the net capitalization of all the railways in the United States. Estimating this

Digitized by Google

as high as $40,000, where $30,000 would be liberal, the account would stand:

SUMMARY SHOWING NET CAPITALIZATION OF ALL THE RAILWAYS IN THE UNITED STATES ON JUNE 30,1912.

Net capitalization 236,444 miles shown supra	$14,196,738,877
12,444 miles not represented at $40,000 per mile	497,760,000
Total for 248,888 miles of operated line	$14,694,498,877
Less assigned to other properties in 1910	36,953,808
Net capitalization of all railways in United States in 1912	$14,657,545,069
Net capitalization per mile of line	61,508
Net capitalization per mile of track	41,204

CAPITALIZATION OF FOREIGN RAILWAYS.

If anything were needed to demonstrate the remarkably low figure at which American railways have been built, equipped and financed, it would be supplied by the next statement, which gives the capital cost or cost of construction of the railways of the principal foreign countries compiled from the latest available sources :

SUMMARY OF CAPITALIZATION OF PRINCIPAL FOREIGN RAILWAYS.

Year.	Country. Europe—	Miles Line.	Capital or Cost of Construction	Per Mile.
1911	Un. K'dom	23,417	$6,447,969,398	$275,354
1910	Ger. Emp.	36,740	4,163,615,519	113,326
1908	Rus. Em.*	41,888	3,378,839,810	80,902
1909	France ..	25,017	3,593,660,000	143,648
1910	Austria ...	14,038	1,654,207,119	117,837
1910	Hungary ..	12,821	858,732,000	66,977
1910-11	Italy** ...	8,908	1,131,300,000	126,886
1907	Spain** ..	8,980	692,818,000	77,151
1908	Portugal ..	1,465	162,385,280	110,830
1909	Sweden ...	8,366	277,952,716	33,224

*Includes Asiatic Russian railways.
**(State).
***Including Asiatic Russia.
‖New South Wales railways are 4 ft .8½ in. gauge; New Zealand and Queensland 3 ft. 6 in., and Victoria (all but 121 miles) 5 ft. 3 in.
‡Including government subsidy.
§About two-third 5 ft. 6 in. gauge, remainder 3 ft. 3½ or 2 ft. 6 in. gauge.

Japan affords the latest illustration of how capitalization of railways can be swelled through government ownership. Under private ownership Japan's railways were capitalized at $42,800 per mile. When taken over by the state their capital was increased to $78,820 in 1909, to $83,220 in 1910 and to $86,343 in 1911. Jonah's gourd was the Eastern prototype of Japanese state railway financing. But it must be admitted that the Germans set the example. Twenty-one years ago (1891) Germany's railways were capitalized at 250,390 marks per kilometer, in 1900 at 270,455 marks and in 1910 at 292,753, or an increase of 42,363 marks per kilometer, or $16,246 per mile in nineteen years. An American contractor with German labor at Japanese wages could build and equip the entire German railway system, ex land damages, for $16,246 per mile. However, in the matter of railway financing the Germans are phlegmatic people compared to the vivacious modernized Japanese.

COST OF CONSTRUCTION.

No feature of the railway statistics is more illusive than that which attempts to get at the investment in road and equipment. In 1910 the Commission, after excluding switching and terminal companies, than which there is no more essential, inseverable and expensive railway investment, arrived at $14,387,816,099 as the net investment in road and equipment for 226,114 miles of line. This figure was incorporated in the official balance sheet for that year.

From the returns of this Bureau, identical with those made to the Commission for the year 1912, the following statement of the investment in 236,444 miles of operated line has been compiled:

COST OF ROAD AND EQUIPMENT FOR THE YEAR ENDING JUNE 30, 1912 (236,444 MILES OF LINE REPRESENTED).

Item—	Amount.
Investment in road (196,831 miles represented)	$8,062,975,146
Investment in equipment	1,919,756,292
Investment unsegregated	2,913,474,712
Total investment reported	$12,896,206,150
Rental of 39,613 miles of line capitalized at 5 per cent	2,600,478,140
Total 1912	$15,496,684,290
Total 1911 bureau	15,251,636,991
Total 1910 official balance sheet	14,387,816,099

The reader hardly need be told that these figures do not come within billions of representing the first investment in American railways. He has seen in the chapter on equipment how that item, which has been practically replaced during the last fifteen years, must have cost, at a reasonable estimate, about $3,500,000,000. The accounts so far as kept show that equipment has cost less than 20 per cent. (19.24) of the total. Applying this percentage to the known cost of equipment would indicate about $18,000,000,000 as the actual cost of railway property up to June 30, 1912.

Moreover, there is no means of even approximating the millions upon millions expended since the inception of railways eighty years ago upon lines whose records, if ever kept, have been lost or which have gone through receivership and reorganizations which have overtaken 131,000 miles of American railways whose capitalization reaches nearly $8,000,000,000.

Nor does it include the appreciation of railway property, especially at terminals, during the past three-quarters of a century. There can be no claim that there is any "unearned increment" about such appreciation, for it is the creation of the railways. The rail has brought increase of billion upon billion to the land value of almost every State in the Union.

PHYSICAL VALUATION OF AMERICAN RAILWAYS.

Now that both branches of Congress have yielded to the agitation for a physical valuation of the railways, for which there is no valid reason, except clamor based on the false popular impression that there is some definite relation between rail investments and rail rates, it is timely to recall that up to date every valuaton made by hostile appraisers has demonstrated the excess of values to capital securities.

The following statement gives the results of official State valuation of railway property in Washington, South Dakota, Minnesota and Wisconsin:

Steam Railroads of	Cost of Reproduction	Present Value.	Capitalization.
Washington	$194,057,240	$175,797,025	$161,582,000
So. Dakota.	106,494,503	91,695,132	109,444,600
Minnesota .	360,961,548	309,706,514	300,027,676
Wisconsin ..	296,803,322	240,718,711	225,000,000
Total	$958,316,613	$817,917,382	$796,054,276

Since these valuations were made the State Board of Equalization of Washington has placed an aggregate valuation of $342,515,593 on the property of the steam railroads of that State, or nearly double the "present value" found by the Railroad Commision seven years ago.

In 1910 the railways in Wisconsin paid $2,858,000 taxes. If the railways of Wisconsin are getting a square deal with other taxpayers, this indicates that the value of their property is over $500,000,000.

In February, 1911, a commission appointed by the Railroad Commissioners of Massachusetts to value the assets and liabilities of the New York, New Haven & Hartford Railroad Company made the following finding:

Appraised value of all property	$495,759,638
Liabilities validated	394,145,564
Adjustment surplus	$101,612,074

During the past year a physical valuation of the transportation property of the Lehigh Valley Railroad, exclusive of the coal lands and collieries, has been made by an engineering and accounting force unconnected with the company's staff. The detail figures have not been published, but the result is known to be in the neighborhood of $300,000,000. To this should be added company investments in railway securities valued on their income at over $20,000,000, making a total of over $320,000,000 against a capital charge of $147,113,669.

The railroads have good reason to welcome a physical valuation of their property, as it will forever lay the bogey of overcapitalization. It will serve no other useful purpose except to put an appropriation of several millions at the disposal of the commission or whoever appoints the appraisers.

Recent Railway Developments in Europe

FROM OUR LONDON CORRESPONDENT.

A Superheater at Ghent.

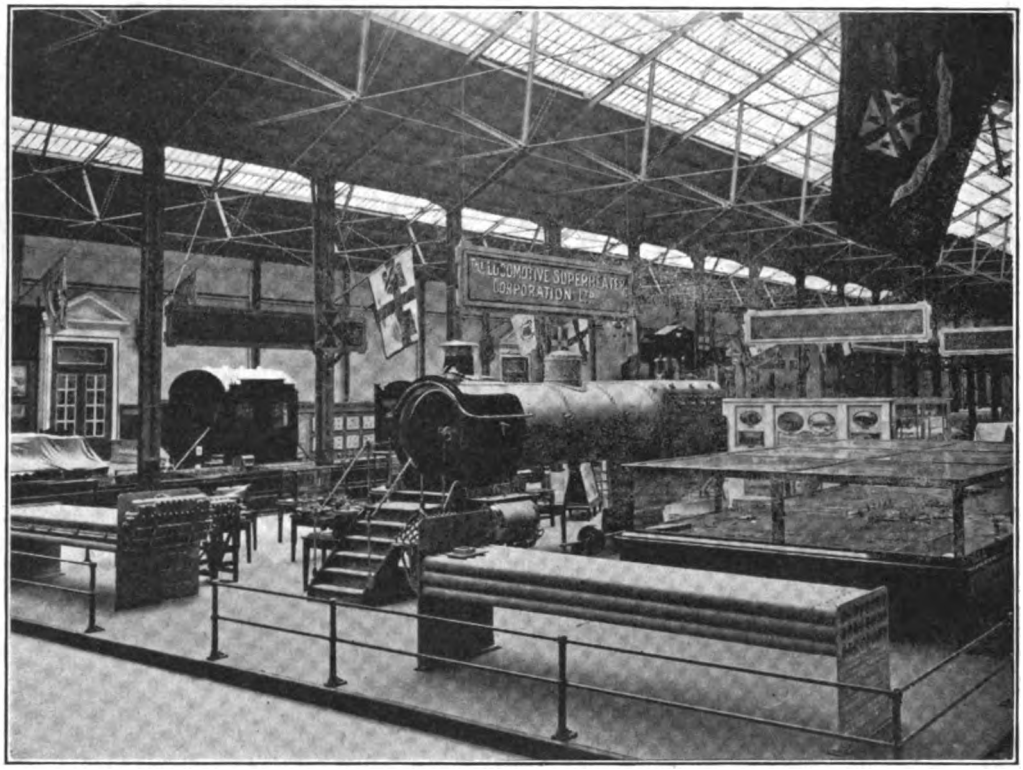
AMONGST the most interesting stands in the railway section of the Ghent International and Universal Exhibition, Belgium, was that of the Locomotive Superheater Corporation on the stand of the Great Central Railway Company of Great Britain. This superheater is the invention of Chief Mechanical Engineer Robinson of this railway. It has a header or steam collector with transverse compartments and removable front cover plate for header with longitudinal compartments and removable top covers. An advantage in the construction is the elimination of flanged or special joints for connecting the elements to the header, the Robinson pipes being expanded directly into the header. It is claimed that the superheater will attain as much superheat as that of any high temperature locomotive smoke tube superheater under equal conditions. The superheated and saturated steam compartments are open at the front of the header to permit of internal examination, and for the introduction of tube expanders into the ends of the superheating pipes which are easily disconnected from the header by using appropriate tools. These superheating pipes or elements, whilst being readily disconnected from the header without sustaining any damage, can be re-expanded into the header. A saving in coal consumption of 25 per cent, water 30 per cent, boiler repairs 20 per cent is claimed for this apparatus, with an increased hauling capacity compared with similar engines using saturated steam and with a boiler pressure of 20 pounds per square inch greater than those engines that use superheated steam at an average working temperature of 650 degrees F.

Oil Locomotive Engines.

A GOOD deal of attention is being devoted in various parts of the Continent to the utilization of oil engines for locomotives, mainly by means of an electric drive, but also to some extent with direct-coupled motors. In Sweden and Norway comparatively small locomotives on the Diesel electric system have been employed for some considerable time and appear to have met with success. They are utilized for small and light trains, and consist of a Diesel engine of about 75-100 horsepower coupled direct to a dynamo, which delivers its current to two direct current motors coupled to the driving axle. It is stated that a considerable reduction is obtained in the fuel cost, which is about one fifth, or even less, of that required in the case of the steam-driven locomotive.

On the Prussian State Railways a large locomotive driven by oil engines and built by the firm of Borgis is now in service. A Sulzer four-cylinder two-cycle engine is used, the two pairs of cylinders being set at right angles, with the scavenge pump arranged vertically and driven off the crank shaft. The locomotive weighs 95 tons (one ton equals 2,240 pounds) ready for service, and at a speed of 60 miles an hour for which it is designed the engine makes just over 300 revolutions per minute. Special arrangements are made for

Digitized by Google



A Superheater Locomotive of the Great Central Railway Company of Great Britain, Exhibited Recently at the Ghent, Belgium International and Universal Exhibition.

the employment of compressed air at starting to give the machine a speed of about six miles an hour before it is run on fuel. A large amount of air storage is therefore necessary, and the locomotive contains a series of air reservoirs for this purpose. For working the air compressor a separate 250 horsepower two-cycle Diesel engine is employed. The main engine is, of course, directly reversible, the system employed being very similar to that adopted in the case of marine engines.

The locomotive has been in operation since the end of last March and satisfactory accounts of its working have been received. Not only has it been used experimentally, but from time to time has been put into the ordinary service and kept to the proper time table. It is understood that it will be run in this way for about a year, after which the decision will be made whether further locomotives of the kind shall be ordered by the Prussian State Railways.

A state train consisting of two motor coaches, each equipped with a petrol or benzol electric set, has been supplied by the A. E. G. of Berlin to the Khedive of Egypt. The coach bodies, which were constructed by the Metropolitan Carriage, Wagon and Finance Company, of Birmingham, England, have a length over buffers of 60 feet and 63 feet respectively, and the total weight of the train is approximately 100 tons without passengers. Each coach is mounted on two two-axle bogies trucks, and the benzol electric sets are carried on the two end trucks, the electric motors being on the central trucks. The engines give a continuous output of 120 horsepower at 700 revolutions per minute. Compressed air is employed for starting, and the fuel feed is effected by some compressed neutral gas, such as nitrogen or carbon dioxide. Each coach is provided with two series wound auxiliary pole motors, each with an hourly rating of 80 horsepower at 300 volts, which work on the axles through gearing having a ratio of 1 to 2.6. The control and speed regulation are on the Ward Leonard system, and arrangements are made so that the train can be driven from the driver's compartment at either end. The motor circuits in the two coaches are distinct from each other, and each generator supplies only the motors in its own coach. The maximum service speed is 40 miles an hour on the level.

Electric Waves for Train Control.

EXPERIMENTS have been made recently on the Bavarian State Railways with the use of wireless electric waves to stop the trains according to a system invented by Herr Christopher Wirth. The apparatus is placed in one of the wagons, preferably in the luggage van, on the roof of which is installed the aerial wire or antenna. Any telegraph or telephone line running alongside the railway may be used as the transmitting antenna, without interference with the telegraph or telephone service The apparatus can transmit a sound or light signal to the engine driver or can operate the Westinghouse brake directly. It can also be arranged to cut off the

Digitized by Google

steam. It is suggested that, according to local conditions, sending stations should be installed at intervals of 80 km. to 100 km. The experiments were carried out on the Nuremburg-Grafenberg line, in conjunction with the Bavarian Railway Department, who, it is stated, regard the scheme as likely to prove useful in reducing the risk of railway accidents.

Steel and Timber Sleepers.

OWING to the scarcity of wood in Belgium, the Belgian railways are obliged to import nine tenths of the timber used for sleepers mostly from Russia. The yearly consumption amounts to about 750,000 sleepers, chiefly of white oak. The maximum price quoted by the Administration is 7.50 francs each, treatment with creosote being included. The Railway Administration has on various occasions been urged to employ steel instead of timber sleepers, and the results of tests that have been made are stated to have proved satisfactory. But, according to a recent official declaration, the use of steel sleepers would not in all cases be an economy. It is stated that a steel sleeper strong enough for the Belgian lines with heavy traffic would cost at least 12f. and its life would probably not be equivalent to that of the timber sleepers at present used, which have been found to last from 18 to 20 years on the main lines, and subsequently for the same number of years on secondary lines. It is claimed, however, that the adoption of steel sleepers would provide the Belgian rolling mills with a new source of employment, as so far they have not regularly engaged in this branch of manufacture.

Passenger Tank Engine.

THE Ateliers Metallurgiques at Tubize have under construction a new tank locomotive, type 13, which is the latest model to be put in service by the Belgian Railway Administration, and is designed to haul heavy passenger trains on secondary lines. The engine is of the six-coupled double-bogie type and has four cylinders (two outside and two inside) with a diameter of 420 mm. and a stroke of 640 mm. The boiler working pressure is 12kg. per sq. m. The heating surface is, in firebox 16 sq. in and in tubes (189 in number) 123.6 sq. m., or a total of 139.6 sq. m. The superheating surface is, 30.15 sq. m. the grate area, 3.15 sq. m., the diameter of the coupled wheels 1,800 m. on tread, and the diameter of the bogie wheels 990m. The capacity for fuel is six tons, and for water 14 tons.

A Naphthalene Locomotive.

THE Creusot works in France have just constructed a locomotive which is driven by naphthalene. Its total length is 5.80m., and its adhesive weight 18 tons. The motor has four cylinders cast in pairs, with a bore of 140mm. and a stroke of 200mm. and develops 70 horsepower at 950 revolutions per minute. Two carburettors are employed, one for starting on spirit and the other for running on naphthalene. The latter is in one piece with the reservoir in which the naphthalene is melted, the whole having double walls, between which the cooling water circulates. This water is maintained at 100 deg. C. and thus the melting is carried out at a constant temperature, which would not be the case if the exhaust gases were used for the purpose. The cost of running is about 0.05f. per horsepower hour, including the spirit consumed in starting. The locomotive is fitted with the Hautier erothermic transformer, which works with air compressed adiabatically and gives infinitely variable transmission between the motor and the driving axle. Among the advantages claimed for this device are better utilization of the engine, increased power on hills, diminution of the stresses on the various working parts, and considerable recuperation of energy on descents. It is thought that the naphthalene locomotive should find an advantageous field of employment in regions where water is scarce or of bad quality, and that it should be suitable for military applications because of the readiness with which it is started, the comparative lightness of the fuel to be carried, and the absence of smoke that might reveal the presence of a train.

British Developments in Railway Freight Handling at Terminals.

THERE has been much talk of late of a scheme for a central clearing house in London to receive and distribute railway goods. On July 16 the promoters gave a demonstration of the mechanical side of their project. If adopted the scheme would revolutionize the terminal handling and cartage of goods. It would abolish all goods yards and would substitute machinery, mostly automatic, for the goods porter and his barrow. The proposed clearing house might in fact be described as a central depot where the shunting would be vertical and the sorting automatic.

There are eleven railway companies in London, owning 74 goods stations and receiving about 320 goods trains every twenty-four hours. These 320 trains require over 700 other trains daily merely to sort the various railway wagons and convey them to other goods stations or shunting yards. At each of these stations the bales of goods in a railway wagon are sorted into various delivery vans by porters with hand trucks.

Under the proposed new scheme all these goods trains from every company would run straight into the central clearing house. This would be a seven story structure, with two levels under the street and four above the street. Immediately below the street level would run 24 railway tracks —the berths for the goods trains loading and unloading. These would be parallel to each other, and would run from end to end of the clearing house. On the street level twelve road bridges at intervals would cross above the railway lines at right angles running from side to side of the clearing house. These would be the berths for carts and road vehicles loading and unloading. Below the railway level would be a cellar. Above the road bridge level would be four sorting floors. The goods would be lifted and lowered from the carts and trucks by cranes.

If the system were carried out in ideal completeness railway wagons and road wagons would consist of a standardized chassis, with a standardized detachable body which would fit either one or the other. The trains would then run into the clearing house. The cranes would lift the

Digitized by Google

body of the wagon with its load bodily. If it was a bulk load for one consignee it would be transferred direct by the crane from vehicle to vehicle in one lift, or if it had to wait for the arrival of its train or road wagon it would be lowered bodily into the cellar. If on the other hand, it consisted of a mixed load of goods for various consignees and various places it would be raised to one of the sorting floors.

As a matter of fact, the standardized detachable body would mean too big a change of rolling stock to be adopted at once or for a long time to come. In the meantime the system is adapted to present rolling stock by the use of what the projectors call "containers." Every railway truck load would have to be in a container, which might be anything according to the nature of the goods —a chain, a rope sling, a skip, a crate, or a complete box like a small furniture van, with doors at the sides and ends. For general goods this last form of "container" would be the usual one. It would be in these containers that the goods would be lifted from the trucks to the sorting floors, and when sorted they would be packed in containers again for transfer by crane to truck or wagon.

It is in the equipment of the sorting floors that the mechanical devices are most elaborate. Of the four floors two would be for heavy bales up to about fifteen pounds. Round and alongside each floor would run endless trains of machines called "truckers"—flat-topped trucks moving continuously at three miles an hour. Each trucker holds a tray which bears the good. These trays slide automatically without concussion on and off the truckers at the various despatching and receiving stations round the floor. Each sorting floor is divided into compartments called "bays," at each of which goods for a particular town are delivered by this sorting machinery. The whole of this sorting machinery is automatic and electric. Once the goods are sorted and loaded on to a tray, the tray is automatically drawn on to a trucker and taken to the proper bay, whether on the same floor or on some other, where it automatically slides off the trucker.

The progress of a bale is as follows: Lifted in a container from road or rail, it is taken out by a laborer and placed upon a tray. An operator reads the address, presses two or three electric buttons, and closes one switch. All the following operations are then purely automatic. The first empty trucker that passes takes the tray and notes electrically at which receiving station it is to discharge it. This station may be on the same train or belt of truckers, or it may be on a different belt and on a different floor, but even in this case the transmission is automatic throughout. On each floor there are six belts. Passing bays, trays, are taken from one belt to another by a main belt on the upper floor by lift belts. A tray may, therefore, pass from a lower despatching bay to a slow belt, from this to a fast belt, from this to a lift belt, from this to the upper fast belt, and from this to the slow belt which passes the required receiving station, and through all these transfers the address is transmitted from trucker to trucker, and the tray is transferred without shock. The bales and parcels assembled in this way at a receiving station are packed in a container, which is lowered by crane to a road or rail wagon leaving for the corresponding destination.

It is quite obvious that this method of handling goods traffic would have a great effect in clearing the streets of London of heavy traffic. Instead of a dozen railway companies, delivering goods, each with their own vans, to precisely the same places, one delivery with one set of vans would do the whole work. The promoters hold that it would reduce the congestion of the streets by 70 per cent.

Personal

Correction.

THROUGH a typographical error, Mr. J. M. Hannaford was reported in the September issue of the Railway World as having been elected president of the Great Northern Railway instead of the Northern Pacific. It is a matter of regret that this mistake occurred, and it is hoped this notice will correct any erroneous impression derived therefrom.

H. M. Biscoe.

HOWARD M. BISCOE, who was recently appointed Vice-President of the N. Y. C. & H. R. R. R. Co., in charge of the Boston & Albany Railroad, was born in Westboro, Mass., July 3, 1869, and after attending the public schools entered Yale College and graduated in the class of 1892. He entered the service of the Boston & Albany Railroad as clerk in the freight department at Boston in December, 1892 and, except for a few months when he was employed by another railroad, he has served that company continuously ever since.

In 1893, he was appointed Foreign Freight Agent of the company at Boston; in 1905, General Freight Agent in February, 1910, Asst.

H. M. Biscoe.

Digitized by Google

Freight Traffic Manager; and in July, 1911, when the Boston & Albany Railroad was made a separate property and operated under the direction of a vice-president located at Boston, Mr. Biscoe became Traffic Manager.

R. J. McCarty.

R. J. McCARTY, vice-president of the Kansas City Southern Railway, who has recently been put in charge of the accounts of that Road, was born in Clarksburg, Va., March 12, 1851. Graduated at University of Virginia in Mathematics in 1871. Axeman, rodman, transitman and assistant engineer International and Great Northern Railroad, 1871 to 1874. Graduated at University of Virginia in Engineering 1875. With Kansas Rolling Mill Company at Kansas City, Mo. 1875 to 1879. Assistant Engineer and Acting Chief Engineer "Cotton Belt", 1879. With K. Secretary and Auditor, The Kansas City Southern Railway Co. 1900. Vice President, The Kansas City Southern Railway Co. 1907 to date.

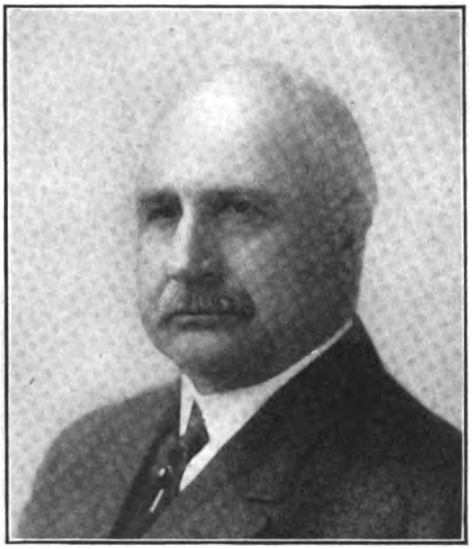
W. L. Martin.

W. L. MARTIN, who became general manager of the Denver and Rio Grande Railroad Company on September first was born in 1863 at Keokuk, Ia. He entered railway service in 1878, and since that time has been consecutively to February 2, 1880, clerk and telegraph operator, Missouri, Iowa & Nebraska Rd. at Keokuk, Ia.; February 2, 1880, to July 1, 1880, assistant agent at Alexandria, Mo.; July 1, 1880, to June 1, 1881, agent same road same place; June 1, 1881, to July 5, 1881, with Western Union Telegraph Co. at Kansas



W. L. MARTIN.

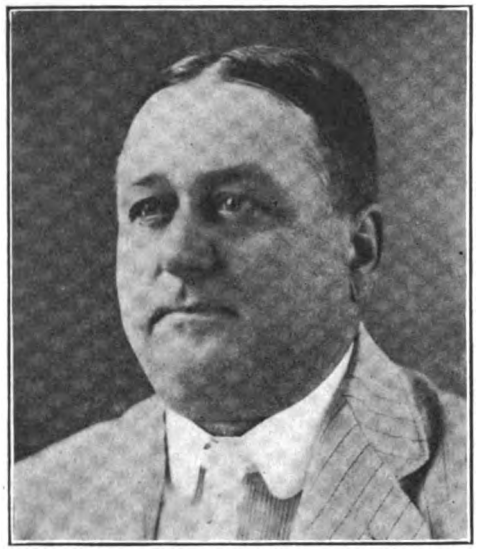
City Mo.; July 10, 1881, to September 20, 1881, operator freight office Wabash, St. Louis & Pacific Ry. at Keokuk, Ia.; September 20, 1881, to January 3, 1882, operator in dispatcher's office; January 3, 1882, to January 3, 1883, dispatcher, and January 31, 1883 to January 4, 1885, chief dispatcher same road at Centerville, Ia.; February 14, 1885, to April 15, 1887, chief dispatcher Louisville, Evansville & St. Louis; April 15, 1887, to July 1, 1889, master transportation same road; July 1, 1889, to November 15, 1889, trainmaster Nashville & Decatur division L. & N.; November 15, 1889, to October 1, 1891, assistant superintendent Nashville Division Louisville & Nashville Rd. and Nashville, Florence & Sheffield Rd.; October 1, 1891, to April 1, 1895, superintendent Owensboro & Nashville Rd.; April 1, 1895, to January 1, 1898, superintendent Louisville Division, Louisville & Nashville Rd.; January 1, 1898, to September 1, 1900, superintendent Henderson & St. Louis division same road at Evansville, Ind.; September 1, 1900, to April 1, 1902, general superintendent Denver & Rio Grande Rd.; June 1, 1902, to December 31, 1912, superintendent Southern Ry. at East St. Louis Ill., and Princeton, Ind.; January 1, 1903, to May 31, 1907, general manager Mexican International Rd.; June 1, 1907, to September 1, 1913, assistant general manager Denver & Rio Grande R. R. at Denver; appointed general manager September 1st.

A. D. Lightner.

A. D. LIGHTNER, who recently was appointed chief officer of operation and traffic of the New Orleans, Texas and Mexican Railroad, was born February 2, 1866, at Keokuk, Iowa. He entered railway service with the Atchison, Topeka and Santa Fe at Wellington, Kansas in 1883, as operator and clerk and in 1885 became agent for this road, occupying positions at various stations in Southern Kansas. In 1890, he was appointed traveling freight agent of the Frisco-Santa Fe joint lines at Carthage, Mo., and in 1896, became general agent of the Frisco at Dalas, Texas. In 1899, he was transferred to the St. Louis offices of this road, and in 1904 became general agent

Digitized by Google

of the executive department and general manager of the Birmingham Belt at Birmingham, Ala. In 1906, he was made superintendent of the Southeastern and Ozark divisions of the Frisco lines with headquarters at Memphis, Tenn., and in 1907, he again became general agent of the executive department and general manager of the Birmingham Belt. In February, 1912, his duties were enlarged to that of general agent of the executive, traffic and transportation departments of all the Frisco lines and president of the New Orleans Terminal Company.

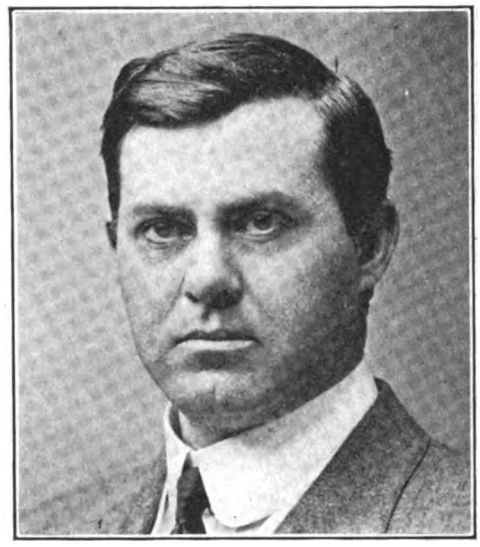


A. D. LIGHTNER.

George Bradshaw.

GEORGE BRADSHAW began railroad service in 1902 with the Chicago & North-Western in the investigation of personal injuries and damage to property. He remained in that capacity for seven years when he accepted employment in the same line of work with the New York Central and Hudson River Railroad. After two years he was assigned by the Vice President of that company to special service in the investigation of accidents with a view of determining causes and methods of prevention, being perhaps the first person designated by any railroad to devote his entire time and attention to the prevention of accidents. As a result a safety department was organized including all New York Central Lines and he was put in charge as General Safety Agent which position he retained till March, 1913, when he resigned to take up the Safety Work on an independent basis as a Safety Engineer being likely the first person to adopt this line of work as a profession. During his administration of the Safety Department of the New York Central Lines, there was a remarkable decrease of injuries in all branches of the service.

Mr. Bradshaw is well known as a lecturer and writer on railroad problems pertaining to safe operation. Since his connection with the New York Central, Mr. Bradshaw has inspected the property and rendered service in an advisory capacity for the Buffalo, Rochester & Pittsburgh, the Merchants severing Despatch Transportation Co., and other transportation and industrial corporations. He was recently engaged by the Grand



GEORGE BRADSHAW.

Trunk System to inaugdrate the Safetyy First Movement and organize a Safety Department for its lines.

S. S. Butler.

S. S. BUTLER, who was recently appointed traffic manager of the New Orleans, Texas and Mexico Railroad, with headquarters at Houston, Texas, was born in Murfreesboro, Tenn., in 1875. He entered railway service in 1899 in the general offices of the Texas and Pacific Railway at Dallas, Texas. He continued in general office work for nine years and in 1898 was made relief agent of the Texas and Pacific, being promoted the following year to traveling auditor. In 1900, he left the services of the Texas and Pacific to become soliciting freight agent for the Frisco Lines at Dallas. In 1903, he was promoted to traveling freight agent for the same

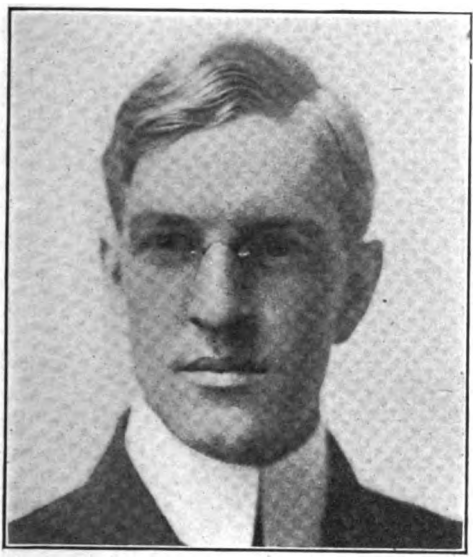
S. S. BUTLER.

Digitized by Google

system, and in 1907, became commercial agent. In 1907 he was made general agent with headquarters at Portsmouth, Ark., and in 1908 was sent to New York as general Eastern agent. In 1912, he was appointed assistant to the vice-president in charge of traffic of the Texas, Louisiana lines, which position he held until his recent appointment. The other roads of the Frisco System of which he has also been made traffic manager are the Orange and Northwestern Railway; Beaumont, Sour Lake and Western and the St. Louis, Brownsville and Mexico Railway.

W. B. Thomson.

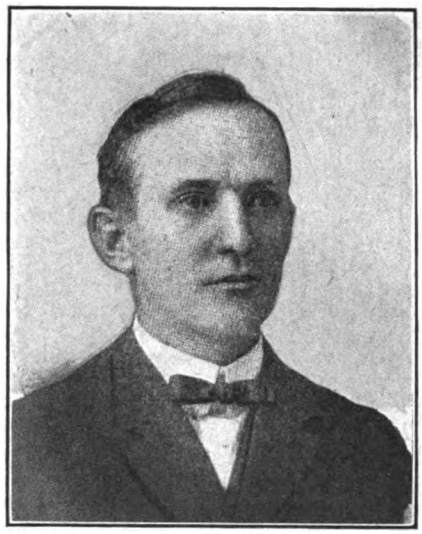
W. B. THOMSON, who has been made valuation engineer for the Wheeling and Lake Erie Railroad, began his services with the New York Central Lines with whom, from 1904 until 1909 he occupied various positions including chainman, rodman, concrete inspector, transitman and designer in the office of the designing engineer at New York. From 1909 until 1912 he was assistant engineer in the office of the engineer of structures of the Boston and Albany Railroad. In this capacity he had the responsible charge of the field work and erection of more than fifty bridges sub and super-structure under traffic as well as general design location and investigations for grade crossing elimination. From 1912 until his recent appointment, he was with the Wheeling and Lake Erie as chief draughtsman in charge of general designs, estimates, etc. Mr. Thomson is an associate member of the American Society of Civil Engineers as well as a member of the Cleveland Engineering Society.



W. B. THOMSON.

Frank S. Elliott.

FRANK S. ELLIOTT, who has been appointed general superintendent of the Central district of the Great Northern, with headquarters at Great Falls, Montana, was born September 29, 1865, at Eddyville, Iowa. He received a high school education and began railway work in July, 1882, as a telegraph operator for the Chicago, Rock Island & Pacific. From 1884 to 1889 he was employed by the Chicago, Burlington & Quincy as operator, agent and train despatcher, and the following year he was with the Atchison, Topeka & Santa Fe as train despatcher. He then went to the Northern Pacific as a train despatcher, leaving in 1904 to go to the Great Northern, where he remained until 1905, serving succesively as train despatcher, chief dispatcher, trainmaster and assistant superintendent of the Spokane and Cascade divisions. He was then for one year superintendent of the Denver & Rio Grande at Salt Lake City, Utah, returning to the Great Northern in 1906. For two years he was assistant superintendent of the Dakota, Kalispell, Spokane and Willmar divisions, and from 1908 to 1910 was superintendent of the Northern and Dakota divisions and the Lake district. Mr. Elliott was then made assistant general superintendent of the Western district, with office at Spokane, Wash., which position he held until his recent promotion.



FRANK S. ELLIOTT.

C. L. French.

C. L. FRENCH, who has been appointed assistant general superintendent of the Pittsburgh system of the Baltimore & Ohio with headquarters at Pittsburgh, Pa., was born on December 27, 1866, at Cumberland, Md., and graduated from Allegheny County High School. He began railway work on October 1, 1883, as a messenger in the train despatcher's office on the Cumberland division of the Baltimore & Ohio, and has been in the continuous service of that road ever since. He was later appointed operator and then train despatcher. On June 1, 1899, he was made chief despatcher, which position he held until August 1, 1902, when he was appointed assistant trainmaster. He then became trainmaster at Cumberland, Md., remaining in that position until April, 1910, when he was made superintendent of the Connellsville division, which position he held at the time of his recent appointment as assistant general superintendent of the Pittsburgh system of the same road.

C. L. FRENCH.

G. M. Crownover.

G. M. CROWNOVER, who has been made superintendent of motive power of the Chicago Great Western Railroad, was born at McVeytown, Pa., September 26, 1863. He entered the service of the Illinois Central R. R. at Waterloo, Iowa, April 1, 1881, as machinist apprentice and after serving his apprenticeship and two years as journeyman machinist in April, 1887, was transferred to Clinton, Ill., as roundhouse foreman. April 1, 1892, he was transferred back to Waterloo to take the position of machine shop foreman. In October, 1896, he was promoted to general foreman in charge of the Waterloo shops. From December, 1900, to April, 1902, he was division foreman at Fort Dodge, Iowa. In 1902 the Illinois Central erected new shops at Waterloo and Mr. Crownover was placed in charge as general foreman. Eight months later he was appointed master mechanic of the same road at Freeport, Ill. From November 15, 1904, to December 20, 1909, he was shop superintendent in charge of Burnside shops, Chicago, Ill. On the latter date he resigned to accept the position of master mechanic of the Chicago Great Western R. R. at Oelwein, Iowa, from which he was promoted on September 1, 1913, to that of superintendent of motive power.

G. M. CROWNOVER.

J. E. Duval.

J. E. DUVAL, who was recently appointed superintendent of car service of the Grand Trunk Railway, entered the service of the Canada Atlantic Ry. as agent and operator at Coteau Landing, Que., in November, 1884. He was promoted to train dispatcher in May, 1885, and to car service agent in 1902. Mr. Duval resigned in 1904 to accept the position of chief inspector of the board of railway commissioners of Canada. He left the post in 1906 to organize the Canadian Car Service Bureau and he held the position of manager of the bureau until August 1, 1913, when he resigned to accept his present position.

J. E. DUVAL.

Hollis C. Pearce.

HOLLIS C. PEARCE, who has been appointed general purchasing agent of the Seaboard Air Line with headquarters at Norfolk, was born on June 1, 1867, at Westberry, Que., Canada, and graduated in 1884 from St. Charles-Baromme College at Sherbrook, Que. He began ralway work in 1885, as superintendent's clerk on the Minneapolis, Lyndale & Minnetonka, and was then conductor and later material clerk for the superintendent of construction of the same road. From September 1, 1887, to April, 1903, he was with the Minneapolis, St. Paul & Sault Ste. Marie, consecutively as clerk to the superintendent of construction for one year, clerk in the auditor's office two years, chief clerk to the general superintendent three years, general storekeeper seven years, and purchasing agent three years. He went to the Chicago, Rock Island & Pacific in April, 1903, as assistant purchasing agent, and from May, 1904, to 1906, was general storekeeper of that road. In 1906 he was ap-

H. C. PEARCE.

pointed general storekeeper of the Southern Pacific Company, which position he held at the time of his recent appointment.

A. C. Mann.

ALBERT CLINTON MANN, who recently became purchasing agent of the Illinois Central, with headquarters at Chicago, was born September 1, 1881 at Effingham, Ill. He was graduated from the high school at Decatur, Ill., in June, 1898, and the following year took a stenographic course at Brown's Business College in the latter city. He began railway work January 10, 1900, as stenographer for a commercial aegnt of the Illinois Central at St. Louis, Mo., and later was bill of lading clerk in the same office. In February, 1902 he was advanced to secretary to the general agent at St. Louis, and four months later was transferred to Chicago as secretary and clerk to the coal traffic manager.

A. C. MANN.

In June, 1904, Mr. Mann entered the purchasing department as secretary to the purchasing agent, and was subsequently price clerk and chief clerk in that department. He was promoted to assistant purchasing agent in January, 1912, and in May of that year was made purchasing agent of the Central of Georgia at Savannah, Ga., which position he held until September 1, when he returned to Chicago as purchasing agent of the Illinois Central, as above noted.

E. J. Parrish.

E. J. PARRISH, who has been appointed superintendent of the Fort Wayne division of the New York, Chicago & St. Louis R. R., was born in 1865 in Terre Haute, Ind. He began as a messenger boy for the Western Union Telegraph Co. and while so employed learned telegraphy. He accepted service with the New York, Chicago & St. Louis R. R. as operator, September 14, 1885, and was promoted in December, 1886, to train dispatcher at Conneaut, Ohio. Mr. Parrish

E. J. PARRISH.

was appointed superintendent of telegraph of the same road, with headquarters at Cleveland, Ohio, June 15, 1912. His promotion and transfer to Fort Wayne, Ind., was effective September 1.

Arthur T. Hadley.

ARTHUR T. HADLEY, president of Yale College, who has been made a director of the New Haven System, was born in New Haven, Conn., in 1865. He graduated from Yale College in 1876 and was later student at the University of Berlin. In 1885, he was appointed commissioner of statistics for Connecticut and from 1886 to 1899 he was professor of political science for Yale College. In the latter year he was elected its president. Dr. Hadley is the author of a number of publications dealing with social and economic problems. The one best known to railroad officials being his "Railroad Transportation, its History and Laws," which was published in 1885.

Financial

Summary of Railway Revenues and Expenses for the Fiscal Year.

IN Bulletin No. 51, recently published, the Bureau of Railway Economics has summarized the revenues and expenses of steam railroads in the United States for the fiscal year ending June 30, by the employment of the following table. This table includes returns from railways operating an average mileage of 221,829 miles which was about 90 per cent. of the steam railway mileage of the country.

Briefly summarized, the table shows that total operating revenues during the fiscal year 1913 amounted to $3,057,089,811, or an average of $13,781 per mile of line; operating expenses amounted to $2,118,529,173, or $9,550 per mile of line; the residue, net operating revenue, amounted to $938,560,638, or $4,231 per mile of line. Compared with the fiscal year ending June 30, 1912,

SUMMARY FOR THE FISCAL YEAR 1913 OF REVENUES AND EXPENSES OF STEAM ROADS

Compiled from monthly returns of the railways to the Interstate Commerce Commission and covering the roads included in the monthly report of that Commission, which are those having annual operating revenues of $1,000,000 or over.

the fiscal year 1913 shows an increase in total operating revenues per mile amounting to $1,051, or 8.3 per cent.; an increase in operating expenses per mile of $747, or 8.5 per cent.; a resultant increase in net operating revenue per mile of $304, or 7.7 per cent. Taxes increased $25 per mile, or 4.7 per cent., and there was an increase in net revenue from outside operations. Operating income increased $283 per mile, or 8.3 per cent.

The total operating revenues of the Eastern group of railways increased $2,172 per mile, or 10.2 per cent.; operating expenses increased $1,775 per mile, or 11.9 per cent. while net operating revenue increased $397 per mile, or 6.3 per cent. Taxes per mile increased 5.8 per cent. and operating income increased $334 per mile, or 6.1 per cent.

For the Southern group of railways total operating revenues per mile increased $629, or 6.1 per cent.; operating expenses per mile increases $531, or 7.3 per cent.; net operating revenue per mile increased $98, or 3.3 per cent. Texas per mile increased 5.6 per cent., and operating income per mile increased $80, or 3.1 per cent.

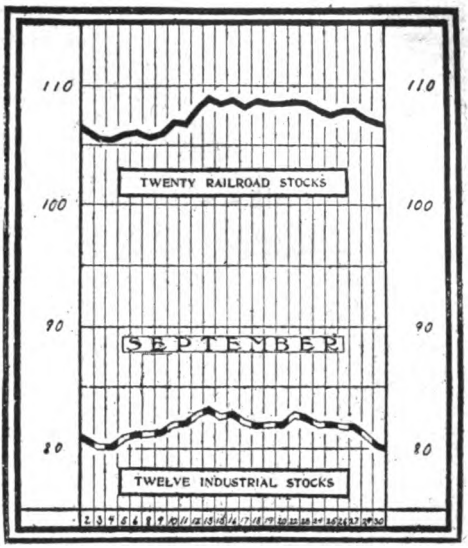
The Western group of railways show an increase in total operating revenues per mile of $758, or 8.0 per cent.; an increase in operating expenses per mile of $402, or 6.3 per cent.; an increase in net operating revenue per mile of $356, or 11.5 per cent. Texas per mile increased 4.1 per cent., and operating income per mile increased $351, or 13.2 per cent.

The Bulletin also contains a summary of the results for June, which reduced to a per mile of line basis and compared with the returned for June, 1912, show an increase in total operating revenues per mile of 5.9 per cent., and an increase in operating expenses per mile of 8.9 per cent. Net operating revenue per mile was less by $1.42 or 0.4 per cent., than that for June, 1912, while that for June, 1912, was 4.4 per cent., greater than for June, 1911.

The Outlook.

UNCERTAINTY is the one word which most accurately describes the present financial outlook; to this might be added caution as the keynote. Paramount in its influence is the new tariff law. The effect of such sweeping tariff changes cannot be easily measured and business is generally marking time, waiting such developments as will give it a more definite and understandable basis on which to go ahead. The crop deficiency is another cause for uneasiness, while the railway situation is at the present time, largely under the influence of the investigation by the Inter-state Commerce Commission concerning the necessity for permitting the Eastern carriers to advance their freight rates 5 per cent.

Railway managers report traffic conditions as fairly satisfactory, although many of their statements indicate that they are anticipating a still further slowing down in the near future. The effect of the new tariff law upon the steel industry is being anxiously watched as a probable barometer for other industrial lines. Currency legislation is another factor helping to charge the outlook with uncertainty, although enough opposition has developed against the present measure to indicate that President Wilson will not have the easy sailing he had in the passage of tariff legislation. Bankers large and small throughout



the country are strenuously opposng the currency bill and in fact the opposition has become so vigorous as to affect democratic members of Congress, with the result that no definite action is now looked for much before December first, if by then.

The Stock Market.

THE stock market continues weak and irregular with small daily transactions. September's movement as reflected by average prices compiled by Dow, Jones & Company showed little net change despite fairly wide fluctuations. On the fourth of September the market reached the low point in both industrials and rails. The accompanying chart shows the trend of twelve industrial and twenty railroad stocks during September:

The twelve industrial stocks used are: Amalgamated Copper, American Car & Foundry, American Smelters, American Sugar, Central Leather, General Electric, National Lead, Peoples Gas, United States Rubber common, United States Rubber 1st preferred, United States Steel and United States Steel preferred.

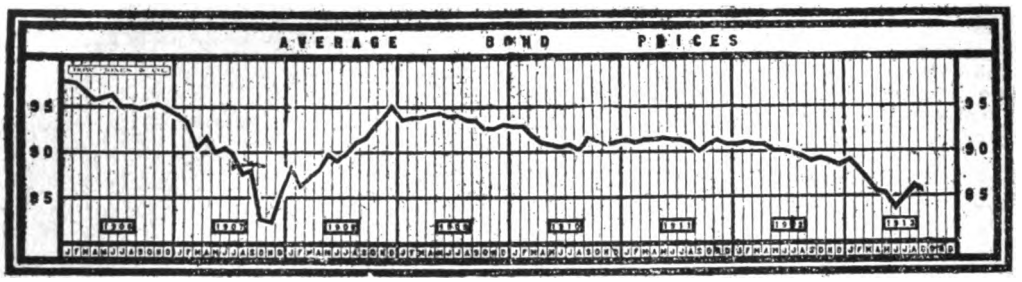
The twenty active railway common stocks used are: Atchison, Baltimore & Ohio, Canadian Pacific, Chicago North Western, Chicago, Wilwaukee & St. Paul, Delaware & Hudson, Erie, Illinois Central, Lehigh Valley, Louisville & Nashville, Missouri Pacific, New York Central, Rock Island, Southern Pacific, Southern Railway, Norfolk & Western, Northern Pacific, Pennsylvania, Reading, Union Pacific.

The Bond Market.

ACCORDING to the Wall Street Journal, the advances in bond prices which started in June and continued through July and August, met with a setback in September. Twenty-five representative railroad bonds closed at the end of the month more than one-third of a point on the average below the prices at the end of August. The following chart shows a decided decline from the sharp upward movement that was recorded for July and August.

However, the situation has again shown tendencies of improvement and it is well known, that

Digitized by Google



at their present prices, good railway and industrial bonds constitute unusual bargains for investment purposes. With the exception of two months in 1907, prices have not been so low for eight years. An indication of the recent improvement in the market has been the rapid sale of $10,000,000 Baltimore and Ohio equipment trusts on a 4 1-2 per cent basis, and also the quick sale of $7,130,000 similar Southern Pacific securities on a 5-1-4 per cent. basis. Equipment trusts which were selling not long ago on a 5-1-2 per cent. basis, have now moved up to where the return is nearer 5 per cent.

These signs of an improved market are unusually welcome to railroad officials, as steps must soon be taken for a large amount of new financing. Refunding of a vast amount of short termed issues must soon be accomplished and there are already indications that arrangements are being made and plans considered to consolidate much of this indebtedness and convert it into more distant maturity issues. It is hoped of course that this can be done at a lower interest rate than that which present issues bear and for this reason the market is being narrowly watched. Certainly the feeling seems to be growing that present rates are too high, that the current cost of capital is not waranted, and that this is perhaps as good a time as any to test the market with securities bearing a more conservative rate of interest.

The first road to take steps to provide itself with financial machinery wherewith to conduct its refunding operations was the St. Paul. Nothing is known of pending plans, but it has been pointed out that the mortgage under which the $30,000,000 of 4-1-2s were put out in April is practically closed. While it is not expected that any new bonds will be issued immediately, this can be looked for shortly after the mortgage is authorized.

The Southern Railway also is preparing to enter the bond market, if not with the intent of obtaining new capital, at least with the idea of consolidating its funded debt. Its plan is said to follow the lines laid down by the Chicago, Burlington & Quincy, the Great Northern, and to be similar to those contemplated by the New York Central and the St. Paul. The first two named have mortgages for $300,000,000 and $600,000,000, respectively. The Southern Railway wants one of $300,000,000, under the provisions of which outstanding indebtedness will be retired and new issues floated as desired. As in the case of the St. Paul, none of these issues is expected in the near future, the beginning of 1914 being mentioned as probably the most likely time for the first offering. Although the report of this contemplated mortgage is officially labeled premature the existing condition leaves no doubt of the wisdom of such action.

Earnings and Dividends.

RAILWAY earnings continue to show unfavorable results. Returns of 77 leading roads operating in the United States show for August, an increase in gross of 1.06 per cent., but a decrease in net of 12.95 per cent. as compared with the same month of last year. This compares with an increase in gross for July of 4.98 per cent. and a decrease in net of 6.45 per cent.

The operated mileage covered by these roads for August, 1913, equaled 177,142 miles, as compared with 175,309 miles for August, 1912, an increase of 1.833 miles. The total operated mileage in the United States is approximately 250,000 miles.

Gross earnings:

	1913	1912	Increase	Inc Per Cent.
77 rds.	$224,792,064	$222,426,604	$2,365,460	1.06

Net earnings (after deducting taxes and including the results of outside operations):

	1913	1912	Decrease	Dec Per Cent.
77 rds.	$62,830,605	$72,180,219	$9,349,614	12.95

These general and important decreases in railway net earnings may be largely attributed to increased wages in various departments, increased cost of material, increased cost of regulation and large expenditures out of gross earnings for maintenance of way and betterments in anticipation of crop yields which have not been fulfilled. In addition, gross earnings have been restricted by disappointing crops, by accumulative reductions in transportation rates made by numerous state and inter-state railroad commissions and by the hestitating attitude of business on acount of tariff and other legislation, so that it is little to be wondered at that net results have proven so unfavorable. It would not be surprising if this decrease should reach the labor question in a very definite manner before the close of the year. Furthermore these developments tend to strengthen the railroads contention that a general increase of rates is necessary if they are to maintain their plants in proper condition. In fact with some roads it has reached beyond this point and the more pressing question of solvency is receiving increased attention. The crux of the whole situation appears to rest in higher operating costs, the only relief from which appears to be an increase in transportation charges .

While there have been fortunately, but few railway receiverships during the year, there has developed a rather imposing list of railways which have been forced either to pass or reduce their dividends. The record shows five carriers

Digitized by Google

which have been forced to take the former action and five which have been compromised by a reduction in rates. As to increases in dividend rates, practically none of importance has been registered by the railroads.

The following table gives a list of the companies that passed or reduced their dividend in the current year together with their outstanding capital stock and present and former dividend rate:

Dividends Passed.

	Capital.	Old rate.
Boston and Maine com.	$38,529,791	4%
Boston and Maine pfd.	3,149,800	6%
Cleveland, C. C. and St. L. pfd.	10,000,000	5%
National Rys. of Mexico, 1st pfd.	28,831,000	4%
St. L. and San Francisco 1st pfd	5,000,000	4%
Western Maryland pfd.	10,000,000	4%

Dividends Reduced.

	Capital	Old Rate	New Rate
Bangor and Aroostook	$3,198,600	4%	2%
Chesapeake and Ohio	62,792,500	5%	4%
Illinois Central	109,296,000	7%	5%
New Haven	157,863,300	8%	6%
St. L. Southwestern pfd.	19,893,650	5%	4%

Figures for the fiscal year ending June 30th, while not displaying quite the startling tendencies of the results for July and August, show a normal increase in gross, accompanied by such an abnormal increase in operating expenses and taxes as to result in a net income wholly inadequate to meet the pressing transportation demands of the American people. In other words, while the gross revenues for the fiscal year 1912-13 exceeded those for the fiscal year 1909-10 by over $384,000,000 the net income increased less than $4,000,000 of this imposing figure. How the industry can expand under such tendencies is a problem which requires the immediate attention of all those responsible for the maintenance of a progressive plant.

Steel Corporation September Statement.

THE September statement of the United States Steel Corporation shows that unfilled orders on the books of the various subsidiary companies on September 30 were 5,003,785 tons. This is a decrease of 219,683 tons as compared with the unfilled tonnage carried at the end of August.

The corporation is still receiving specifications on contracts at a rate which will keep present capacity active during the balance of the year. It is an interesting fact that export business has been quite heavy recently and has compensated for some loss in domestic business.

The unfilled orders on the books of the subsidiary companies are now approximately what they were on December 31, 1911, there having been a steady decline in the unfilled tonnage since December 31, 1912.

Annual Reports.

ANNUAL reports for the fiscal year, with few exceptions, show favorable results. Without a knowledge of true conditions, however, these statements are apt to prove misleading inasmuch as the increase in operating expenses which has been so characteristic of railway activities of the past few months, did not begin to have a marked effect until well into the present calendar year. For this reason the fiscal year figures do not indicate, as they might, the downward trend in net results which has recently characterized operations. On account of the number of reports received, it is impossible to do more than briefly refer to each in the following paragraphs:

The report of the New York, New Haven & Hartford Railroad Company for the year ended June 30, 1913, shows net earnings of $21,386,164, a decrease of $1,442,882 from the previous year. The surplus after charges was $8,922,237, a decrease of $4,463,312. In order to pay dividends amounting to $13,486,563 the company incurred a deficit of $4,564,325, an increase of $3,634,335. The operating expenses showed an increase of $5,600,027, and the ratio of operating expenses and taxes to the gross revenue was 74.24 per cent. as compared with 70.68 per cent. the preceding year.

President Elliott says that while the earnings for the first few months of the fiscal year were the greatest in the history of the company for a similar period the net results of the year compared with 1912 show a large decrease due to "heavier operating expenses, which reflect principally the expenditures made by the company to put the property and equipment in better condition to handle business safely and promptly and to pay increased wages."

In further explanation of these figures, President Elliott goes on to say:

"The unfortunate accidents at Westport, Conn., on October 3, 1912; at Stamford, Conn., on July 12, 1913, and at North Haven, Conn., on September 2, 1913; the continued investigations for several years of the company and its operations, and the resulting demoralization and expenditures made the year one of unusually heavy outlays.

"While the human factor was one cause for the deplorable accidents referred to, the management did not attempt to evade its full responsibility, and the efforts of the officers and employes were and are being systematically devoted to raising the railroad and service to higher standards of efficiency and discipline, all necessitating larger expenditures and higher wages."

The increase in the cost of operating, the report says, is a general condition affecting all the railroads of the country. All these conditions, it is explained, made it necessary to reduce annual dividends from 8 per cent. to 7-1-2 per cent. This reduction was made during the last quarter.

The annual report of the Boston & Maine for the year ended June 30, 1913, shows net earnings of $10,929,378, a decrease of $470,589. This includes the earnings of the eight separately operated lines controlled by the Boston & Maine.

The report shows that additions and betterments totaled $7,939,660 in 1913, of which $3,815,715 has been charged to leased roads. In 1912 additions and betterments were but $3,350,980; in 1911, $10,998,084; and in 1910, $4,698,499. Expenditures during the past year included for shops, enginehouses and turntables, $1,698,255; additional main tracks, $1,966,365; terminal yards, $613,006, and elimination of grade crossings, $674,053.

During the year $2,094,720 equipment was bought consisting almost wholly of 100 new locomotives.

The report of the New York, Ontario & Western Railway Co. for the year ended June 30, 1913, shows net earnings of $2,955,308, an in-

Digitized by Google

crease of $935,906. The surplus after charges was $1,211,633, equal to 2.08 per cent. on the capital stock, as compared with 0.81 per cent. earned the previous year. Operating expenses during the past year showed a decrease of $9,501.

The annual report of the Erie Railroad shows an income account as follows:

	1913.	1912.	1908.
Gross	$62,647,359	$56,492,370	$49,784,236
Net	16,146,760	13,984,117	8,752,540
Other inc.	6,133,812	4,059,039	2,916,498
Net inc.	22,634,411	18,043,156	11,669,038
Fixed chgs.	14,528,736	14,016,341	13,292,460
Surp for divds.	7,340,156	3,377,203	*1,623,422

*Deficit.

In 1908 Erie failed to earn its fixed charges by $1,623,422; last year the company earned a surplus of $7,340,156 over its fixed charges, which was equal to 4 per cent. in both the first and second preferred stock at 4-1-4 per cent. on the $112,378,900 common. Since 1908 gross earnings have increased from $49,784,000 to $62,647,000, and the operating ratio has decreased from 82.4 per cent. to 73.5 per cent.

Record earnings for the Reading system are shown in its report for the year ended June 30, last, in a net corporate income of all three companies of $15,099,874, as compared with $8,082,214 the year before. This is equivalent to 17.57 per cent. earned on the common stock of the Reading company, against 7.54 per cent. the previous year.

Gross receipts of the railway company for the year were $52,214,894, an increase of $6,389,179. Operating expenses increased only $2,030,462. Net receipts from operation of the railway were $21,667,553, an increase of $4,358,716. The increase in the coal freight revenue was $2,936,730 and that in revenue from merchandise freight was $2,555,508. The railway carried a surplus for the year to its profit and loss account of $2,794,105, against a deficit of $890,006 the year before.

Gross earnings of the coal company for the year were $40,893,063, an increase of $5,249,410 over the year before. Expenses of operation were heavy, increasing $2,583,606, leaving the large increase in net revenues of $2,665,803. The balance carried to profit and loss account was $1,139,592. There were mined during the year 11,089,742 tons of coal, against 8,671,013 tons the year before.

Gross earnings of the Reading Co. were $15,392,261, an increase of $1,539,803. Fixed charges and taxes of the three companies decreased $11,472 during the year. The funded indebtedness of the Reading Co. was decreased by $904,000 in the year.

President Baer says that the increase in wages to the engineers and firemen resulting from the arbitration award will cost the Reading $160,000 more annually.

Jersey Central earned 26.73 per cent. in the year ended June 30, 1913. This compared with 21.9 per cent. in 1912 and 26.05 per cent in 1911. Dividends paid were 12 per cent. a year.

The surplus for the year 1913 amounting to $7,332,882 was thus distributed: $3,292,416 in dividends, $2,832,285 expended in additions and betterments and $1,208,182 placed in a fund for future additions and betterments.

The feature of Jersey Central's year was the expenditure of $7,858,239 in additions and betterments. This was provided without financing. From previous funds $3,738,747 was taken, $1,287,207 was charged to capital account and the 1913 income account provided $2,832,285.

The report of the Chesapeake & Ohio Railway Company for the year ended June 30, 1913, shows net earnings of $10,633,718, against $11,654,189 the previous year. The surplus after charges was $3,298,503, equal to 5.25 per cent. on the stock outstanding, as compared with 6.8 per cent. earned the preceding year. Unprecedented floods in the James River and Ohio valeys in March seriously affected gross and net earnings, and another adverse factor was the prolonged strike by coal miners in certain sections of West Virginia, which materially reduced the output of the mines affected. Notwithstanding these handicaps, gross revenues increased $795,409 over the year before, but operating expenses increased $1,815,879 and taxes were $361,643 above those of the year previous.

In the year ended June 30, last, Southern Railway earned a balance available for dividends on the common stock equal to 3.39 per cent. against 3.13 per cent in the previous year.

Gross earnings made a new high record at $68,529,000, an increase of $4,939,000, but operating expenses were $4,577,000 higher, giving net after taxes a gain of only $350,000. With the preferred stock on a full 5 per cent. per annum basis last year, the preferred dividends were $300,000 above 1912, leaving $4,078,625 available for common stock dividends.

To profit and loss account for the year was added $4,029,694, making this account as of June 30, after deuctions of $412,343, $17,374.558.

The report of the Norfolk & Western Railroad Co. for the year ended June 30, 1913, shows net earnings of $15,174,107, an increase of $1,108,300 over the previous year. The balance available for dividends was $11,106,641, which after allowing 4 per cent. on the adjustment preferred stock, was equal to 10.17 per cent. on the common; as compared with 9.87 per cent. earned in 1912. The operating expenses showed an increase of $2,896,383. The ratio of expenses to operating revenue was 65.31 per cent. against 64.6 per cent. the previous year.

The report of the Kansas City Southern Railway Company for the year ended June 30, 1913, showed gross earnings of $10,706,309, an increase of $1,433,450 over the previous year. The year's total net income amounted to $3,661,795, a gain of $982,972. After deducting $2,015,590 for fixed charges, such as interest, rentals, etc., there was a balance of $1,646,205, an increase of $760,255. From this there was paid $840,000 in preferred dividends, leaving a surplus of $806,205, which is equal to 2.68 per cent. on the $30,000,000 common stock outstanding, compared with 9.15 per cent. earned in the previous year.

The income account of the Illinois Central Railroad Company for the year ending June 30, 1913, shows there was an increase in net income of $3,108,665, notwithstanding the handicap caused by the flood conditions in the southern states which entirely stopped the movement of traffic between the northern and southern lines for a period of nine days, causing not only the loss of considerable revenue but a large expenditure in restoring the portions of the railroad washed out.

The report of the Chicago, Indianapolis & Louisville Railroad Company for the year ended

Digitized by Google

June 30, 1913, shows net earnings of $1,882,007, against $1,728,441 the previous year. The surplus after charges was $538,361, which, after allowing 4 per cent. on the preferred stock, leaves a balance equal to 3.22 per cent. on the common, as compared with 1.99 per cent. earned last year.

Like other roads in the same general territory, Minneapolis, St. Paul & Sault Ste. Marie shared substantially in the increased commercial and agricultural prosperity of the Northwest last fiscal year. And the extent to which Soo did so is reflected in the company's gross earnings, which show an expansion of nearly $4,500,000, or over 25 per cent. In the achievement of this record figure, Soo handled over 1,500,000 tons of freight more than in the preceding year, a performance which was accomplished by measurably better car service and train loading.

The surplus for the year after providing for the payment of fixed charges and the preferred and common dividends amounted to $2,880,701, an increase of 82.6 per cent. over 1912.

The report of the Denver & Rio Grande Railroad Company for the year ended June 30, 1913, shows net earnings of $7,405,793, against $6,295,885 in 1912. The balance available for dividends was $2,076,372, equal to 4.16 per cent. on the preferred stock, as compared with 2.26 per cent. earned the previous year. The number of passengers carried for the year was 1,843,634, as compared with 1,770,179 in 1912; and the rate per passenger per mile increasd from 1.93 cents last year to 2.03 cents in 1913.

The annual income statement of the St. Louis Southwestern Railway Company, the Cotton Belt Route, for the year ended June 30, 1913, showed gross earnings of $13,296,949, an increase of $1,254,406 over the previous year. The railway operating income amounted to $3,599,816, a gain of $449,744. To this was added $1,044,324 in other income, making gross income for the year $4,644,141, an increase of $596,225. Deductions from gross income amounted to $2,757,949, leaving a balance to transfer to the credit of profit and loss amounting to $1,886,191, compared with $1,617,619 at the close of the 1912 fiscal year. This was equal to 5 per cent. on the $19,893,750 preferred stock and an additional 5.45 per cent. on the $19,356,100 common stock, against 5 per cent. on the preferred and 3.8 per cent. on the common stock the previous year.

Minneapolis & St. Louis in the year ended June 30 last earned 7.6 per cent. upon its $5,917,500 preferred stock, returning a surplus available for dividends of $451,894, compared with a deficit after charges of $667,041 for the previous year. Big crops were of course the main factor in causing the reversal, but the merger of the M. & St. L. with the Iowa Central probably did something toward bringing about a more compact and efficient transportation machine.

In the current fiscal year officials of the road expect to equal the earnings of last year and should this eventuate, the company would be upon a basis that might justify expectations for preferred stockholders. The comparatively poor showing of 1912, the year in which the merger with the Iowa Central was effected, put somewhat of a strain upon the road's credit, but the return to better things should go a long way toward strengthening its all around position.

Chicago, Rock Island & Pacific Railway, in its annual report for the year ended June 30, last, shows balance of income, after all charges, of $4,058,355, equal to 5.41 per cent. on $75,000,000 capital stock. Of this amount there was paid out in dividends $3,743,525, leaving a surplus for the year of 314,830, against surpluses of $106,636 in 1912, $1,511,766 in 1911, and $1,004,609 in 1910.

Gross earnings for the last year totaled $71,364,935, an increase of $6,652,081 over the $64,712,853 gross in 1912; gross revenue for 1911 was $68,487,473, and for 1910, $66,220,579. Net revenue for 1913 was $18,860,833, against $17,953,359 in 1912. $19,431,790 in 1911, and $18,151,210 in 1910.

Property investment during the year was increased $9,537,861, representing expenditures for additions and betterments, and acquisition of additional equipment.

The forty-ninth annual report of the Chicago, Milwaukee & St. Paul Railway Company for the year ended June 30, 1913, shows gross earnings of $94,084,054, an increase of $14,828.699 over 1912. Last year is the first that the St. Paul report has included the revenues of the lines formerly owned by the Chicago. Milwaukee & Puget Sound Railway. which was made a part of the St. Paul system last December. Operating expenses last year, including those of the Puget Sound Extension amounted to $62,883,967 or $3,628,783 more t han for the previous year, making net earnings from rail operations equal to $27,551,002. as compared with $18,078.208 in 1912, a gain of $9,472.714.

The year's operating net was swelled to a gross corporate income of $31,523,541 by the addition of $3,972,539 from investments. From this there was deducted $13,382,796 in fixed charges, consisting chiefly of $11,438,141 in interest on the funded debt, which left a surplus of $18,140,744, compared with the combined surplus of the St. Paul and the Puget Sound in 1912 of $9,778,908, an increase of $8,361,836. In 1912 the Puget Sound Extension exhibited a deficit of $151,538, while the St. Paul proper showed a surplus of $9,930,446. Last year's surplus after the payment of the regular dividends of 7 per cent. on the $116,274,900 preferred stock, which required $8,115,233, left a balance for the $116,348,200 common stock outstanding of $10,025,511, equal to 8.6 per cent. This is 3.6 per cent. above the amount now paid by the St. Paul system.

The pamphlet report of the Chicago & Northwestern Railroad shows a prosperous year for that ended June 30 last. The report shows that after deducting the preferred stock dividend and the sinking funds from the net income there was left for the common stock the sum of $12,883,422, or 9.73 per cent., as compared with 7.31 the year previous. Gross earnings were $83,035,921, an increase of $9,337,329 over the previous year. The railway operating income amounted to $21,197,277, a gain of $3,656,405. Other income last year aggregated $3,463,492, making the gross income equal to $24,660,769 an increase of $3,738,003. Total deductions from the gross income were $9,785,755, leaving a surplus before sinking fund and dividends of $14,875,013, an increase of $3,150,473. After the payment of 8 per cent. on the company's preferred stock and 7 per cent. on the common, there remained a balance of $3,775,407 to transfer to the credit of profit and loss, compared with $567,715 in 1911-12.

Operations of the Chicago Great Western last fiscal year netted the road a surplus of $1,245,039,

Digitized by Google

an amount equivalent to 3.03 per cent. on its preferred stock, of which there is $41,021,402 outstanding. This compares with 0.44 per cent. for the preceding year. That the road was enabled to make this showing was due to a 10 per cent. increase freight revenue, and to close handling of operating expenses.

Operations last fiscal year placed the company in a much more substantial position with regard to the prospective payment of dividends at the rate of 4 per cent. per annum on the preferred stock. These dividends become cumulative July 1, 1914, and it is President Felton's estimate that a gross per mile of $10,000, or total gross of $15,000,000 must be earned annually to make secure the payment of these dividends.

Northern Pacific's report for the year ended June 30, 1913, shows a surplus available for dividends of $21,563,518, equal to 8.69 per cent. on the $248,000,000 stock outstanding. Last year 7.93 per cent. was earned on the same amount of stock.

Gross earnings increased $9,252,192, of which $8,477,164 was due to larger freight revenue. The tons of revenue freight carried during the year totalled 21,285,527, an increase of 3,829,552 tons over the year previous.

Two-thirds of Northern Pacific's gain in gross revenues went into additional operating expenses. For maintenance of way and maintenance of equipment $3,651,519 more was spent than in the year before.

Net operating income of $24,312,633 was $2,473,532 larger than in 1912. There was little change in other income and charges. The surplus after all charges, including dividends, totalled $4.203,518, an increase of $1,899,703. Out of this surplus $750,000 was appropriated for sundry claims.

The Great Northern Railway Company, in its report for the fiscal year ended June 30 last showed gross operating revenues of $78,692,767, an increase of $12,494,948 over the previous year. The operating income was $28,076,258, a gain of $3,513,366, operating expenses and taxes consuming $50,138,031 of gross. From sources other than transportation the company derived an income of $3,208,158, making the gross corporate income for the year equal to $31,884,417, from which was deducted $7,316,103 in interest and other fixed charges, leaving a balance applicable to the company's capital of $24,568,313. This is equivalent to 11.7 per cent. on the $209,990,750 stock outstanding, compared with 10.31 per cent. earned in the 1911-12 fiscal year and 8.34 per cent. earned in 1910-11.

Annual Report of Missouri Pacific.

IN his annual report to the stockholders of the Missouri Pacific-Iron Mountain a year ago President B. F. Bush gave credit to the people the railroad system served for the increase in business shown. In his annual report for the fiscal year ending June 30th last President Bush puts squarely up to the people the success of the railroad. He winds up his comments on results of the year as follows:

"The anticipations of a year ago with respect to the operations of the property have been quite fully realized. The transition from a deficit last year of approximately two millions of dollars to a 'Net Income' credit of $1,562,734, is but a corollary to the persistent and economic application of energy directed toward the further development of that recognized unit—the welfare of the public and the integrity of the carrier. As the curtailment, so also the continuation of this development, largely rests with the people served by the Missouri Pacific System.

"Ordinarily, the expression 'density of traffic', meaning in this instance the average number of revenue tons transported one mile per mile of operated railroad—conveys little, but to state that this measure of quantity increased 17.8 per cent. over that obtaining last year, and 28 2-3 per cent. compared with two years ago, can not fail to impress both users of the road and the public in general, not only with the tremendous increased wear and tear which must be currently restored, but also and more particularly with the absolute necessity of making the way clearer for securing funds, properly protected as an investment, so that the patent facility and service requirements of the growing communities may be competently met. Action—and action there must be—looking to the accomplishment of that end, constitutes good citizenship, and carries a nation-wide influence in the common cause of our country, and is an obligation from which no geographic section can exempt itself.

"Wholly apart from and in addition to enormous payments for purchases, the System dispensed this last year in wages alone a sum in excess of $29,000,000.00. It is obvious that the beneficiaries of such disbursement should be ardent progressors and defenders in the solution of all these complex factors which go to make for our mutual and inseparable success."

The figures for the year are most flattering. The total gross receipts are nearly $8,000,000.00 above 1912, which was the biggest year in the history of the company. The total operating revenue for the year closing with June 30th, last was $62,155,506.14, compared with $54,503,249.92 for the year ending June 30th, 1912, an increase of $7,652,256.22, or 14.04 per cent. The total revenue from transportation was $61,671,459.88, against $54,068,092.10 in 1912, an increase for the year just closed of $7,603,367.78, or 14.06 per cent.

Both freight and passenger business show healthy increases. The total revenue from freight for the year just closed was $45,748,269.39, while for the year ending June 30th, 1912, the revenue was $39,514,355.87, a gain for the past twelve months of $6,233,913.52, or 15.78 per cent. The year ending June 30th, 1913, shows a gross revenue from passenger business of $11,627,480.60, whereas the income from this source for the preceding year was $10,662,443.17, an increase of $965,067.43, or 9.05 per cent. for 1913.

The total operating expenses for the year ending June 30th last were $44,698,997.05, while for the preceding year they were $41,280,592.01, an increase for the past year of $3,418,405.04, or 8.28 per cent.

The report also clearly indicates that the good showing was not due to savings in upkeep or equipment, but that on the other hand more money was expended in this direction than during the year preceding. The expenditures for maintenance of way and structures for the year just closed were $9,263,360.32, while for the year ending June 30th, 1912, they were $8,664,769.03, which indicates an increase in this respect of $598,591.29, or 6.91 per cent. For the past year the expenditures on maintenance of equipment

Digitized by Google

were $9,860,187.54, compared with $8,321,786.50 for the preceding year, an increase for the year ending June 30th last of $1,538,401.04, or 18.49 per cent. Thus the increase in expenditures for maintenance of way and structures and for equipment for the year just closed compared with its predecessor amounts to considerably more than $2,000,000.00.

The net railway operating revenue for the year ending June 30th last was $17,363,504.47, and for the preceding year it was $13,101,805.15, an increase of $4,261,699.32, or 32.53 per cent.

The operating revenue per mile of road shows an increase for the year of $1,027.22 or 13.63 per cent., while the operating revenue per revenue train mile shows an increase of 7.91 per cent.

That economy in operation has been preserved is shown in a decrease of general expenses of 2.75 per cent., and a net deficit from auxiliary operations of 23.04 per cent. less than the preceding year.

The railway paid in taxes during the year the large sum of $2,314,348.73, whereas the taxes for the preceding year were $2,218,018.40, making the increase for the past year $96,330.33, or 4.34 per cent.

For fuel for its locomotives alone the company paid $4,379,000.59 during the year. The preceding year the bill for this item amounted to $4,186,981.32, making an increase for the twelve months just closed of $192,078.27.

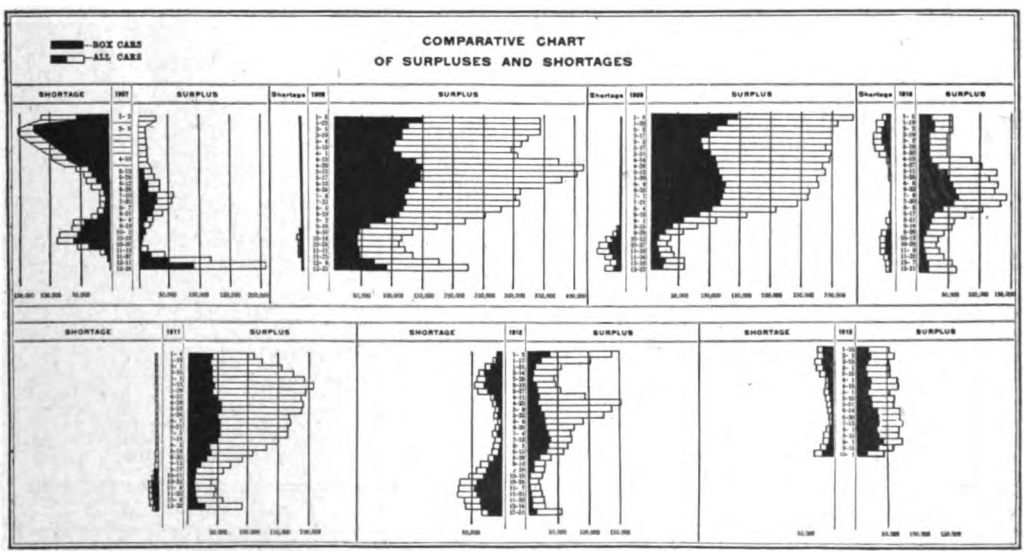
Operation

The Car Situation.

THE latest report of the American Railway Association shows the total surplus of railway cars on October first, to have been 41,994 compared with 61,753 on September 15th, and 26,754 on September 26, 1912. Compared with the preceding period, there is a decrease in the total surplus of 19,759 cars, of which 16,311 is in box, 761 in coal, 3,116 in miscellaneous, and an increase of 429 in flat car surplus. The decrease in box car surplus is in Groups 1 (New England Lines), 6 (Iowa, Illinois, Wisconsin and Minnesota), 8 (Kansas, Colorado, Oklahoma, Missouri and Arkansas), 10 (Washington, Oregon, Idaho, California, Nevada and Arizona), and 11 (Canadian Lines). The decrease in coal car surplus is in all Groups, except 4 (the Virginias and Carolinas), (Texas, Louisiana and New Mexico), and 10 (as above). The decrease in miscellaneous car surplus is in all Groups, except 3 (Ohio, Indiana, Michigan and Western Pennsylvania), 4 (as above), 7 (Montana, Wyoming, Nebraska and the Dakotas), and 9 (as above). The increase in flat car surplus is in Groups 4, 8, 9, 10 and 11 (as above).

The same report shows that the total shortage on October first of the present year amounted to 31,620 cars while on September 15th, it was 21,594 cars and on September 26, 1912, 44,547 cars. Comparisons with the previous year indicate more favorable operating conditions for 1913. Compared with the preceding period there is an increase in the total shortage of 10,026 cars, of which 6,206 is in box, 534 in flat, 2,662 in coal and 624 in miscellaneous car shortage. The increase in box car shortage is in all Groups, except 3 (as above), 5 (Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida), and 8 (as above). The increase in flat car shortage is in Groups 2 (New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania, 3, 6, 8, 10 and 11 (as above). The increase in coal car shortage is in all Groups, except 5 and 6 (as above). The increase in miscellaneous car shortage is in all Groups, except 7 (as above).

Compared with the coresponding period of 1912 there is an increase in the total surplus of 15,240



Digitized by Google

cars, of which 7,736 is in box, 1,800 in flat, 1,759 in coal and 3,945 in miscellaneous car surplus. There is a decrease in the total shortage of 12,927 cars, of which 10,016 is in box, 1,612 in flat, 1,318 in coal and an increase of 19 in miscellaneous car shortage.

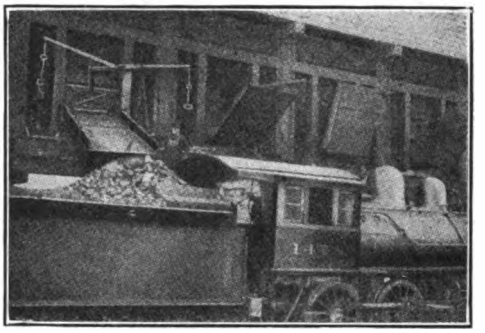
Prevention of Railway Accidents.

MUCH is being written regarding the prevention of railway accidents, not only in the transportation but in the general industrial field as well. A recent publication of real practical value is that by George Bradshaw, published under the above head by The Norman W. Henly Publishing Company of New York.

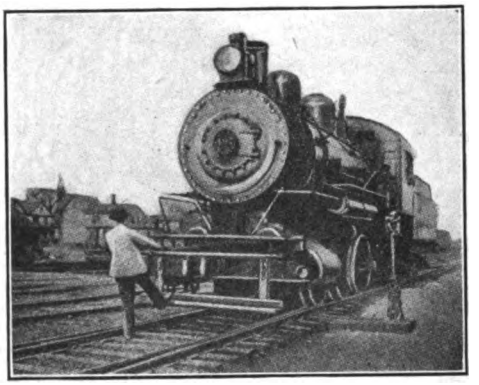
The author of this work was employed by the New York Central Lines in special service for the prevention of accidents and for many years had been constantly engaged in their study. From the mass of facts thus procured, he has formed certain conclusions as to the prevention of accidents and these he presents in the publication referred to in the form of a heart to heart talk with railroad employed. He deals with facts and not with theories and shows the men in the ranks from every day experience how accidents occur and how they may be avoided.

The book is illustrated with seventy original photographs and drawings showing the safe and unsafe methods of work. The volume is replete with plain facts and practical suggestions and every railroad employe who reads it should unquestionably be a safer man to have in railroad service.

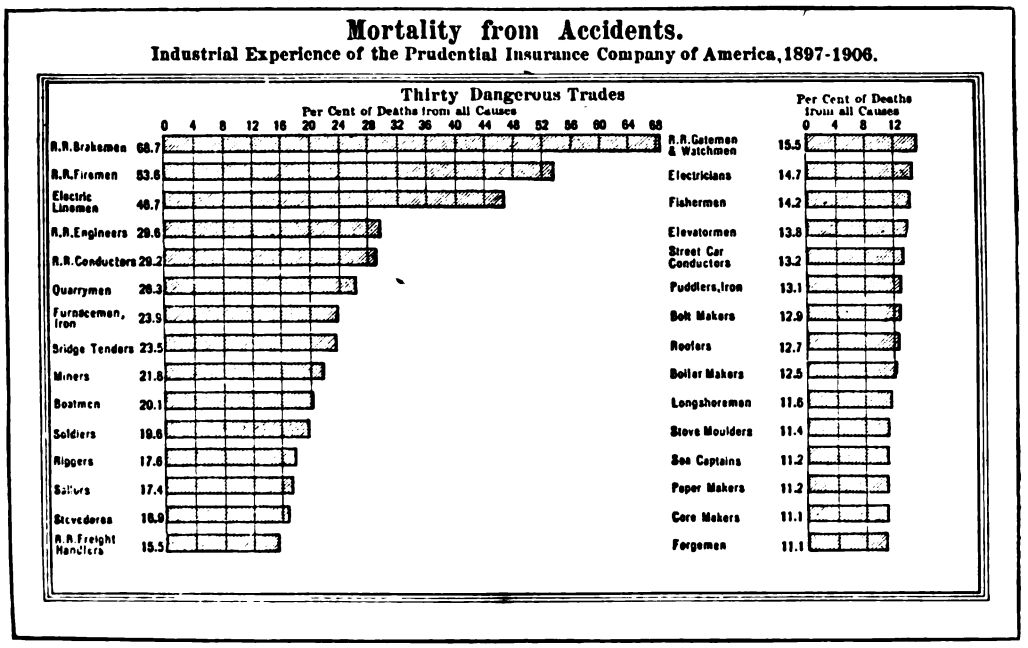
Mr. Bradshaw reaches a conclusion which has been arrived at by many other officials who have been studying the safety problem, namely, that the majority of preventable accidents are due not to defective material or improper method, but to the men themselves. He points out that while considerations of safety still call for much improvement in physical conditions, it is a fact that



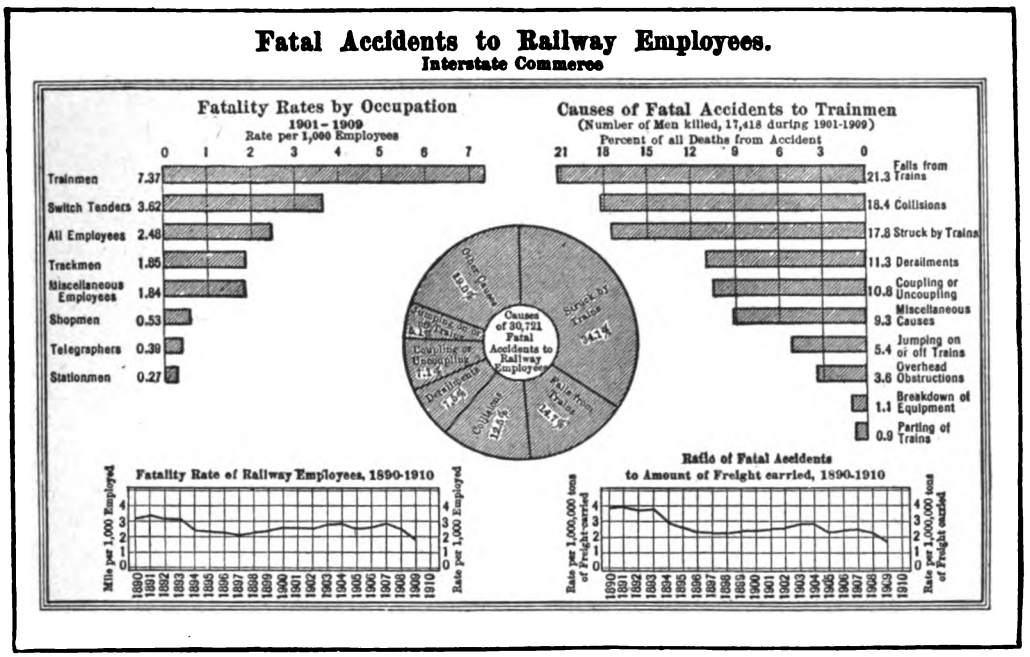
ON THE WRONG SIDE OF THE COAL APRON.
Backward movement by engine would be likely to injure or kill man.



A DANGEROUS AND UNNECESSARY WAY TO JUMP UPON FOOT BOARD OF ENGINE.
Should be done from outside of rail.



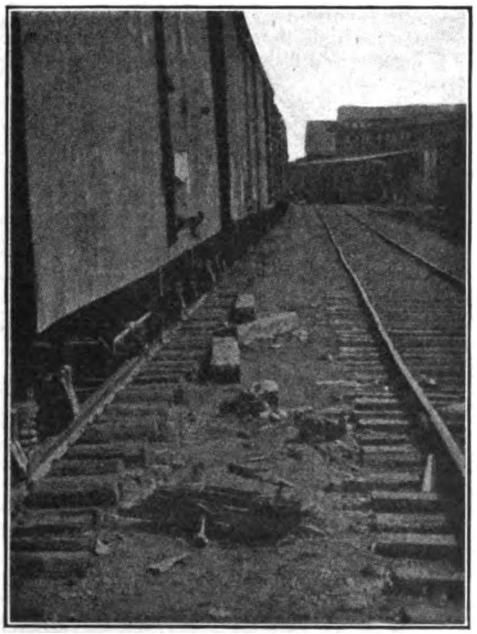
Digitized by Google



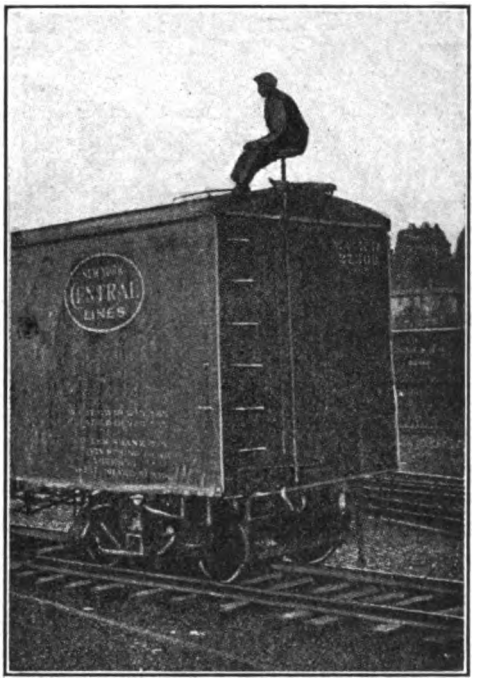
in no field of activity has there been greater material advancement than in railroading. In spite of this, however, the record of injury to employes has been growing worse every year. In discussing the human element, Mr. Bradshaw points out the seriousness of the personal injury problem, how the employes are the real sufferers from present conditions, how they are personally responsible for the injury record and how they can improve it.

Two charts of peculiar interest which appear in this volume, are herewith produced, one showing the fatal accidents to railway employes for a number of years and another showing the mortality from accidents to those engaged in various occupations both within and without the railway service.

Another notable recent contribution to this gen-



A Condition Full of Dangerous Possibilities in a Local Freight Yard, Which Could be Easily Corrected.



Sitting on the Brake Wheel of a Moving Car is Dangerous Practice, as a Sudden Jar is Likely to Throw the Employe to the Ground.

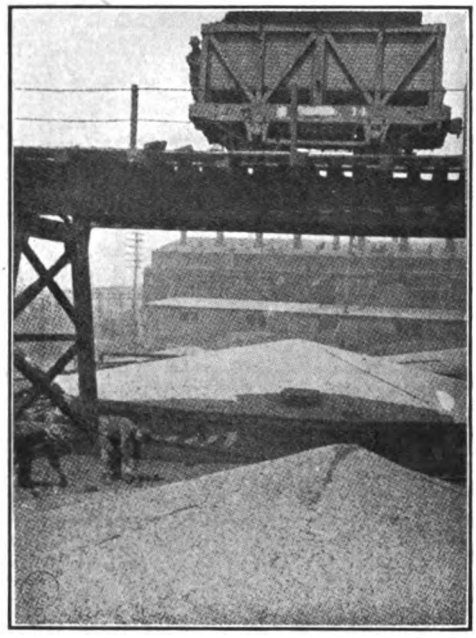
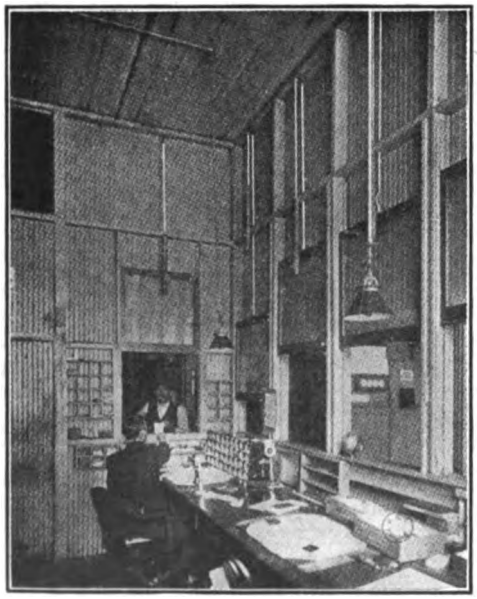
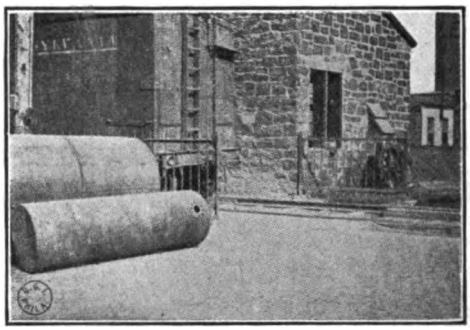
eral subject, is a work prepared by James B. Douglas, manager of the claim department of the United Gas Improvement Company. This volume is replete with practical illustrations, showing the hazards to be encountered in the yards and in the buildings peculiar to the industry which his company represents. Many of the illustrations,



AN ORDINARY COAL TRESTLE SHOWING SEVERAL LARGE PIECES OF COAL DROPPED FROM CARS TO EDGE OF TRESTLE.



SASH WEIGHTS, COUNTERBALANCING SLIDING WINDOWS HUNG DIRECTLY OVER THE WINDOWS AND TABLE. SHOULD ROPE BREAK A SERIOUS ACCIDENT MIGHT OCCUR.



FENCES PLACED ON EITHER SIDE OF TRACK OF INDUSTRIAL PLANT TO COMPEL EMPLOYES IN CROSSING TO WALK OUT FURTHER FROM THE BUILDINGS.

however, are of such a general character as to be applicable to the railway field, as indicated by those herewith reproduced. Mr. Douglas has gone into this question in a very thorough manner, and his illustrations, which number nearly 100, cover a wide scope and are of the highest educational value in connection with the general subject of greater safety. While prepared for the use of the employes of the various interests associated with the United Gas Improvement Company, the book would be a valuable addition to the library of every railway official who is making a study of the greater safety movement.

The Trespassing Evil.

MANY prominent roads continue with unabated efforts their campaign against the trespassing evil. While at the present time the headway made has not proved very encouraging, railway managers are known for their tenacity to stick to a task until it has been successfully accomplished, and sooner or later they are going to impress upon public officials the necessity for more stringent laws and for their more general application in handling this unnecessary evil.

One of the latest contributions to this effort is in the form of an article by Marcus A. Dow, general safety agent of the New York Central Lines, published in a recent issue of the Outlook, under the head of "A Nation's Neglect". Mr. Dow's article is illustrated by a number of photographs showing the manner in which both minors and adults are constantly trespassing on the right of way of railroads several of which are herewith reproduced. In fact Mr. Dow's road is conducting a vigorous campaign against trespassing and is trying to invoke the aid of the law in New York State to stamp out this reckless practice. This campaign, it might be noted in passing, is in the interest of humanity and to prevent the unnecessary killing and laming of thousands of valued citizens as well as women and children rather than from any direct or indirect benefit to be derived by the railroad. Warning notices have been posted along the entire system and a special representative has been assigned to the work of interviewing every justice of the peace, police court magistrate and city court judge in towns along the line, to seek their cooperation and bring about a more rigid enforcement of the law. The road is also seeking the co-operation of manufacturers by personal communication, asking them to warn their employes

Digitized by Google

A SHORT WAY TO THE BALL GROUNDS. THESE LITTLE CHILDREN SHOULD HAVE BEEN TOLD BY THEIR PARENTS OF THE DANGER OF CROSSING RAILWAY TRACKS.

against walking the tracks and is following this up by making arrests where the warning has been disregarded. While this special campaign has been in operation only about two months, a marked improvement is already noted in localities where the work has been carried on, arrests made and punishment administered. One of the handicaps in procuring successful results from such efforts, is that the majority of states have no adequate laws prohibiting railway trespassing, and the public is little informed as to the great number of lives sacrificed in this manner and the social status of the majority of people thus killed and injured.

Mr. Dow points out in his article that more than 5,000 people are killed annually and as many more seriously injured from this unnecesary practice. In other words, fourteen human lives are snuffed out and as many more maimed for each day of the year. Besides women and children, those killed represent thousands of able bodied men whose value to the community, to their families and to themselves as producing elements and wage earners, has been either entirely lost or forever impaired.

As a result of an exhaustive study of the whole situation, Mr. Dow is of the opinion that two things are absolutely essential to curb the fast

THE COUPLING OF AN ENGINE AT THE OTHER END OF THESE CARS WOULD SURELY MEAN DEATH OR SERIOUS INJURY TO ONE OR MORE OF THESE BOYS.

FACTORY WORKERS BY THE HUNDRED WALK UPON THE TRACKS HOMEWARD BOUND. OFTEN THINKING OF EVERYTHING ELSE BUT THE FACT THAT THEIR LIVES ARE IN DANGER.

Digitized by Google

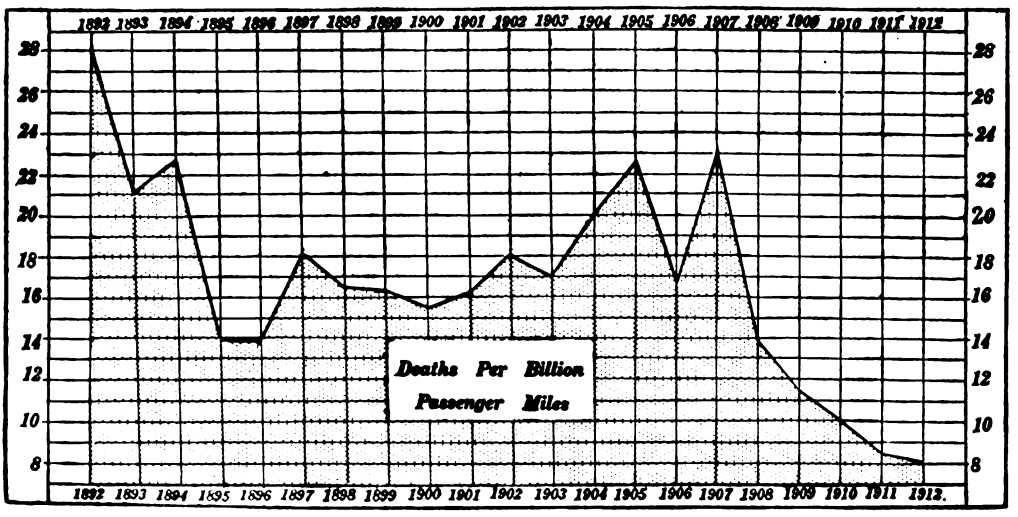
growing trespassing evil, namely, education and legislation. To quote from his article:

"Education properly conducted is an important step in the right direction, but this fearful loss of life and limb can never be successfully checked until we have the intervention of a proper law and law-enforcing powers. It is true that in some States there are statutes making trespassing on railways a misdemeanor and punishable by fine or jail sentence. But there is no uniformity throughout the States, and experience has shown that in the States where such laws exist it is difficult to obtain convictions even when an arrest of a trespasser is made. Magistrates are prone to discharge the offender and cast a censuring eye upon the railway officer who made the arrest. There seems to be a mistaken idea in the public mind that if a railway company attempts to prosecute such offenders, it is assuming a domineering and contemptible attitude, or exercising unduly the power of wealth over an obscure individual. But why should this be so? What is there to cause a railway corporation or official to assume such an attitude? What reason has a railway for wasting its time and money arresting, prosecuting, and campaigning against such offenders? A man does not damage the railway ties by walking on them. There is no legal redress for the trespasser who is injured unless willfully. Is it not possible for the public to give the railways the benefit of enough generous thought to say that, after all, it is probably a commendable and humane desire on the part of the railway officials to stop as far as possible a needless and fearful slaughter? But the railways are greatly handicapped. They cannot take any concerted and effective preventive measure because they have no law, and, worse yet, no public or judicial interest to any great extent, back of the giving them the right or authority to exclude, under penalty of the law, these trespassers from their property. It is the very absence of these laws and judicial and public interest that leads the average citizen to believe that railway rights-of-way are public highways, upon which they have a right to be and the children, following the example of their parents, brothers, uncles, and cousins, gather about the tracks, playing about turntables, in freight yards, hopping on and off cars, and indulging in other dangerous pastimes, with the result that in nearly every city or town there are children crippled or maimed from this cause, and thousands of cemeteries contain the bodies of little ones sacrificed. And all because this great Nation, the most progressive and humane of all people, has not awakened to the seriousness of the problem—because we are the only civilized Nation in the world that has no National law prohibiting, under the penalty of a penitentiary sentence, trespasing on railway tracks, and because in those few States where there are such laws there is a woeful neglect to enforce them. The total number of railway employees and passengers killed on our railways each year is less than the total number of trespassers killed and if it is worth while for the railways to spend millions of dollars to install and improve safety devices to prevent the killing of their own employees and passengers, why, I would ask, is it not worth while that some effective legislative action be taken by our Government to protect and save the lives of more than five thousand trespassers annually and the limbs of many thousands more? It would not cost the Nation a penny, and the saving to it of a vast economic loss, not only in the lives of its citizens, but in the reduction in the number of its helpless cripples, would be inestimable."

Decrease in Railway Accidents.

RAILWAY accidents have within recent months, been given so much publicity that a general belief has been developed that such casualities are on the increase. As a matter of fact, the reverse is true, and the following chart prepared by the Annalist, New York, graphically illustrates the reduction which has occurred in the past five years. In considering railway accidents in this country, it is customary to figure their percentage on the basis of the number of passengers carried. This makes American roads appear much more dangerous than those of Europe. As the Magazine of Wall Street points out, however, such a statistical method does not take into account the fact that in

The Falling Rate of Mortality in American Railway Travel



Digitized by Google

America each passenger rides many more miles than in Europe, where distances are short. If we figure on the basis of "Passenger Miles", or in other words, the number of passengers multiplied by the miles each one travels, we find that travel in America is fully as safe as in Europe.

Automatic Block Signals for the Southern.

THE Southern Railway Company is now installing an automatic electric block signal system on the main line between Seminary, Va., and Orange, Va., a distance of 80 miles, all double track. This system will be similar to the type which has given splendid results on the double track stretches between Denim, N. C., and Charlotte, N. C., and between Monroe, Va., through Lynchburg to Montview, Va., and when completed will provide continuous automatic signal protection for trains from Orange into the Washington Terminal Station, giving in all a total of 198 miles of double track protected by this system on important stretches of the Washington-Atlanta main line.

Safety Developments on the Southern Pacific.

THE principles of modern advertising are being adopted by the Southern Pacific company in its "Safety First" campaign of education among its men. Not only is every effort being made to see that operating rules are enforced, but additional force is being given to the movement by constantly keeping before the minds of employes by other means the folly of carelessness in railroading. Letters of instructions, bulletins, paychecks, and similar papers, go out bearing a striking escutcheon with the words "Safety First" prominently appearing on it. Buttons with a like design are worn by the men on the lapels of their coats. A further step contemplates posting advertising signs on bulletin boards wherever employes congregate. They will be short and snappy, worded with a view to keep everyone thinking along lines of safety.

On all divisions, photographs and lantern slides are being prepared to reproduce in a realistic manner actual conditions that result in accidents. They will be explained by trained lecturers who accompany the examination car.

The Southern Pacific Company has been fortunate in not having killed a passenger on any of its passenger trains for the last five years. It now wants to educate the men to take more care of themselves. President William Sproule is devoting much of his personal attention to this campaign. As he says, "Human life and limb are the dearest things we have, and this most certainly applies to employes as well as to the patrons in our charge. Familiarity with hazardous conditions is apt to make workers minimize their danger. We hope by education to make them watchful of themselves. The lantern slides will show the folly of attempting to save a little time by jumping on the running board of an approaching locomotive, of getting between cars in coupling them, of leaving tools where they may fall upon a fellow worker, or even of such minor details as that of throwing a board on the ground with a nail sticking upward in it. "Safety First" is to be a real thing both for passengers and employes on the Southern Pacific. With block systems, steel cars and heavy rails, we are supplying the mechanical needs. By education, we hope to counteract the personal equation in so far as it may endanger safety."

Western Maryland Inaugurates a Pontoon Bridge Service.

BY putting in service the first pontoon bridge ever used in the Baltimore harbor in connection with the transfer of loaded cars from the piers to bargos, the Western Maryland Railway Company has paved the way for the general use of such bridges at the terminals in the Monumental City.

So far, the new structure has given entire satisfaction, and is proving daily that the transfer of equipment from the land to barges, can be done in much less time than is possible by the use of the old-style bridges which have been a fixture in the local harbor for years. This kind of bridge has been utilized by the trunk lines in New York for the movement of loaded railroad cars in Gotham's harbor, but up to this time, they have never been introduced in Baltimore.

The great advantage of this character of bridge is that its operation is extremely simple, and the maintenance cost small, which means greater economy to the railroad using it. The structure can also be adjusted to a barge or deck in much less time than can be done with the use of the old bridges. This is a strong factor in expediting the handling of traffic on barges. The structure is lowered to meet conditions by turning water into the pontoons, and is raised, when necesary, by the water being pumped out by an electric pump. The process of either lowering or raising the bridge is perfectly simple, and the adjustment takes place in the course of a few minutes, thus saving much time and labor.

New Locomotive Regulations on Baltimore & Ohio.

ENGINEMEN and firemen of the Baltimore and Ohio lines have been asked to use every effort to prevent locomotives attached to trains standing in passenger stations and at other places around terminals from "popping off". Frequently it happens that passengers hurrying past a locomotive to board their train are startled by a sudden "popping off" of a locomotive, and there is a possibility that persons might be frightened to such extent as to cause serious harm. A mother, for example, carrying an infant in her arms and looking after the safety of young children traveling with her, might be scared by a "popping" engine and drop the child; or a person carrying a valuable parcel might be surprised to the degree of dropping the package and breaking its contents.

Aside from the protection which this new rule affords to passengers, the railroad company hopes to effect an economy in the use of fuel and energy because it is a well known fact that the needless waste which results from engines blowing off steam tends to run up the charges of conducting transportation. It is possible to obtain the greatest efficiency from a locomotive without wasting a pound of steam.

Mechanical

A New Method for the Construction of Seamless Tubes.

MARSHALL B. LLOYD.

REPRESENTATIVES of seamless tube manufacturers recently inspected in Detroit, a new invention for the production of seamless tubes, which does away with the 100 or more distinctive operations in their production and combines all in one continuous operation without waste. The invention, if it proves successful, threatens to revolutionize the industry, in which there is now invested some $200,000,000 in manufacturing plants.

The machine employed in the new method is so compact it occupies but three feet by twenty feet of factory space. A double machine, producing two tubes at once can be operated by two men. The hot or cold rolled steel is fed into it at one end and the tubing comes out at the other end. Every step is automatic and radically different from anything now used—forming, welding, straightening, sizing, polishing, drawing and even cutting being performed by the machine without deterring the forward progress of the steel. The machine turns out the finished polished tube at a rate of 4,000 feet a day in any size, weight, form, or length desired.

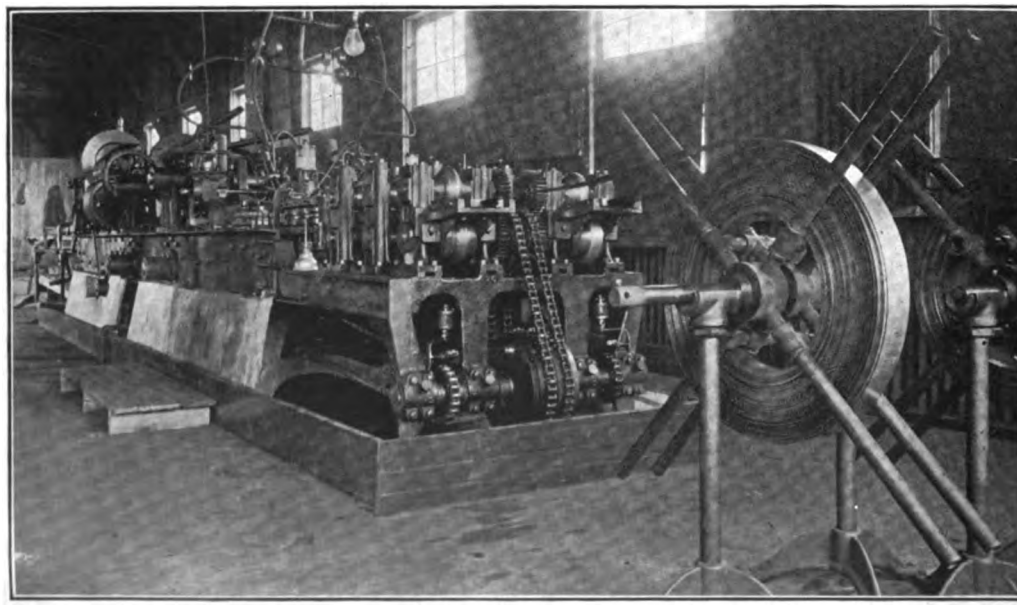
Advantages claimed for the tube produced are:

No waste.—The only waste in the entire operation is 1-16 of an inch in the cutting of the tube into the desired length. Present production methods incur waste of as high as 30 per cent in some processes.

The thinner the tube, the cheaper.—This reverses the present best basis, which is based on the greater amount of labor required to draw the tubes to finer sizes. As the size of the automatically machined tube is determined by a simple adjustment of the machine, the material used alone regulates the cost.

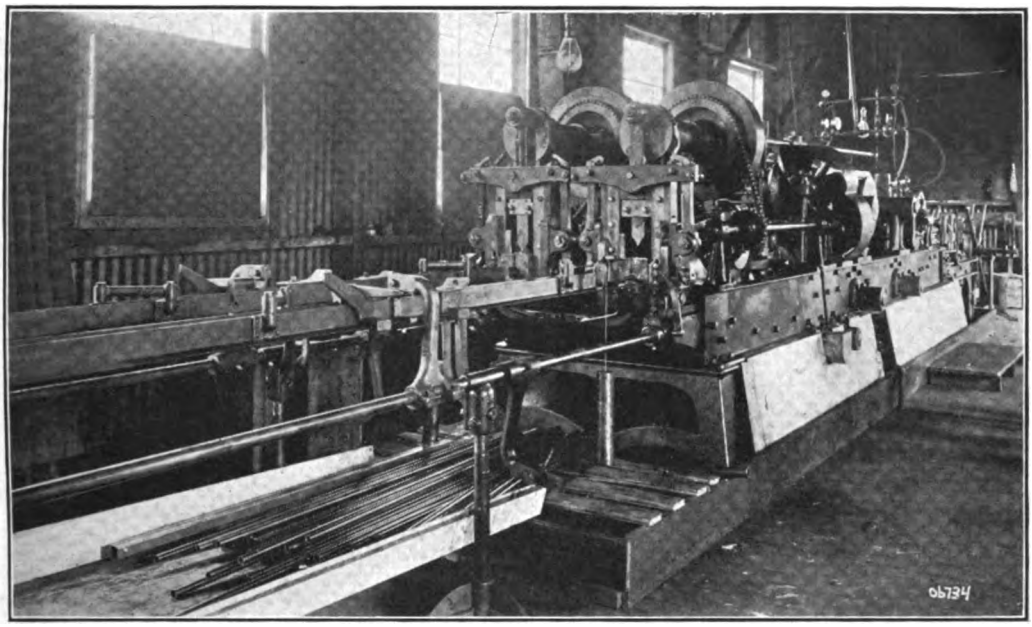
Uniformity of thickness, molecular tension, and resistance are assured, a variation of only .001 to .0005 inch in thickness was recorded by the micrometer in testing the tubes made by the machine while under inspection of experts.

Irregular shapes.—By ready adjustment, any desired shape of tube is made; standard forms, as oval, round, square, hexagon, etc., and irregular shapes, such as grooved round tubes for automobile wind shields, etc. No additional expense is incurred in the production of the irregular shape; no more time is required for its production.



ROLLED STEEL BEING FED INTO RECEIVING END OF NEW SEAMLESS TUBE MANUFACTURING MACHINE.

Digitized by Google



THE MACHINE TURNS OUT THESE FINISHED POLISHED TUBES AT A RATE OF 4,000 FEET A DAY IN ANY SIZE, WEIGHT, FORM OR LENGTH.

Saving in labor.—No special training in tube production is required to double machine.

Any size.—Tubing from one to seven inches diameter can be turned out by the standard machine by making adjustments. Larger tubing can be produced by building a special machine.

No weak point.—The method of threading the automatic tubing converts the weakest point of present tubing into the strongest point of that produced by the new invention. Instead of cutting threads into the ends of this tubing, the threading is built onto the ends of the new tubing, thus increasing its capacity to withstand pressure.

In this connection, while a 10 gauge, 3½ pound pipe is tested at a water pressure of 600 pounds, the 20 gauge is tested at 3,000 pounds water pressure. Mr. Lloyd asserts that his lighter tubing will stand greater pressure than the heavier grades now used.

The machine as demonstrated saves about 90 per cent in labor in the production, and reduces the total cost of production by about 50 per cent.

As the machine is so compact, it can readily be set up in the shop of any manufacturer using seamless tubes in his products.

The company organized to market the invention announces that it will not sell its machines but will license manufacturers to their use on a royalty basis. Marshall B. Lloyd, president of the Lloyd Manufacturing Company, Menominee, Mich., is the inventor of the new process.

Outlined in brief, the process used in the automatic production is:

The flat metal strip is drawn through a series of small rollers to form it into the tube shape with a mandrel of peculiar construction on the inside. The tube emerges from theese rollers to all appearances a seamless tube, the edges being even and tight. It then passes a device that holds the tube into position to be welded, the edges of the metal being melted by the use of gases. A small thin burr shows where the metal flowed together. This is removed with a knife and the tube is smoothed with a small emery wheel. It now passes into a large powerful vise with half round jaws, continually traveling and gripping about two feet of the tube stock. This vise is as powerful as the ordinary draw bench and is virtually an automatic bench in itself. When it emerges from the vise, it is sized and polished by cold rolling with water. It then passes through a straightening device, without interfering with forward movement, is cut off and dropped into a receptacle on the floor. In appearance the tube appears to be nickel plated, so smooth and bright is the polish.

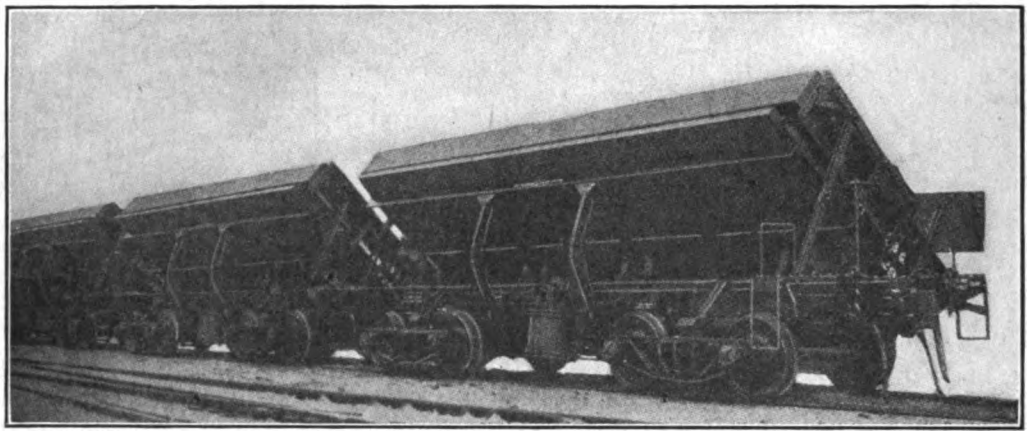
One of the prominent tube manufacturers who had seen this process in operation said: "All the improvements in the history of tube making are only a trifle compared to the vast importance of what Lloyd has done. All I hope is that no one concern will ever obtain control of it. If the inventor carries out the plan on which he proposes to operate, namely, to license everybody who wants it, present prices of tubing will be cut in half. It will do for the tube industry what the cotton gin did for cotton and the reaper for agriculture. The saving in waste alone will mean a saving of millions a year to the tube industry."

Automatic Air Dump Cars.

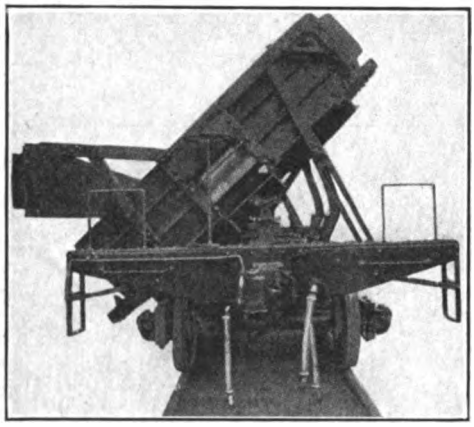
THE Railway World has presentd from time to time, descriptions of automatic dump cars. A recent development along these lines, is a car manufactured by the Kilbourne & Jacobs Manufacturing Company of Columbus, Ohio, which is unlocked, dumped, righted and relocked automatically by the application of air drawn from the air brake train line.

The car is dumped by a piston on one side, and

Digitized by Google



UNDER-SIDE OF DUMP CARS, SHOWING AIR CYLINDERS AND OPERATING MECHANISM.



END VIEW OF STEEL AIR DUMP CAR, SHOWING HINGED DOORS.

is righted by another on the opposite side, the operating devices for each side being separate and independent. The storage reservoirs are placed between the draft sills and are charged directly from the air brake train line.

The car is designed to dump upon the high side of a curve as well as upon the low side. Trains can be dumped simultaneously to the right or left; alternate cars can be dumped on opposite sides, or any portion of the train can be dumped independently. They dump at an agle of 44 deg., throwing the material clear of the track and thus largely eliminating danger of derailment. The unlocking and relocking of cars is automatic and being locked in transit they cannot dump accidentally.

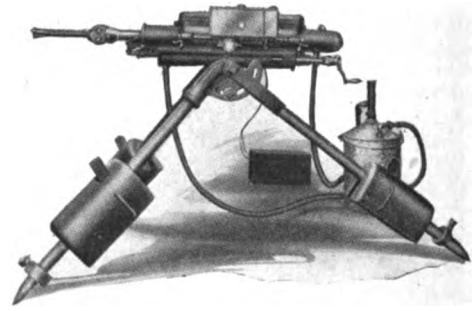
The car is constructed of steel throughout with the exception of the floor which is of hardwood. The doors are of steel box girder type and are suspended at the top from the lifting levers so that they are free to swing out when struck by the dumping load. The car conforms to the specifications of the Master Car Builders' Asociation and the Interstate Commerce Commission and is designed for use in freight trains at all ordinary speeds.

This type of car is built in three sizes.

The accompanying illustrations give a general idea of the car's appearance.

A New Gasoline Rock Drill.

THE field of air and steam rock drilling has been invaded by a drill using gasoline as the agency of motive force, upon principles new to all prior efforts in the gasoline drill development. It is an entirely self contained drilling unit, consisting only of the drill and tripod, and requires no other equipment, which particularly recommends it for use in contracting, mining, prospecting, tunneling, trenching, railroad construction, subways, etc. Mr. John V. Rice, Jr., of Philadelphia, is the inventor, and it is the outcome of his many years association with the rock drill industry.

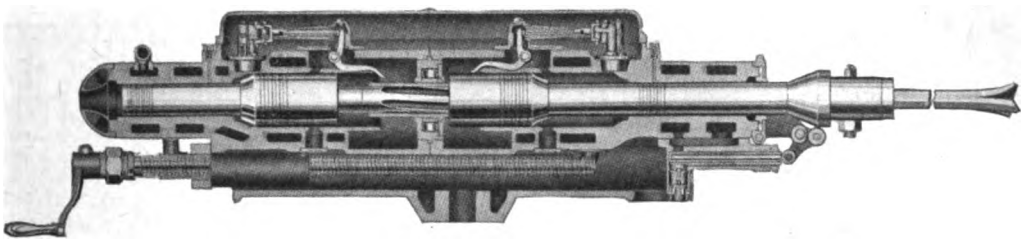


A COMPLETE POWER PLANT READY FOR USE.

The drll has a full floating, free piston action. The piston rod, pistons and bit are all connected together, forming a direct striking piece, acting and striking the rock in the same manner as the air and steam drills of to-day. Little difference in appearance can be noted between this drill and the standard air or steam drills, excepting the noticeable absence of the usual auxiliary equipment of steam boilers, air compressors and piping necessary to them.

The motive force of this gasoline drill is furnished by two cylinders opposed to each other. A piston rod, fitted with a piston for each cylinder and on the end of which is the bit chuck, continuing through the two cylinders. A make and break spark plug for each cylinder are tripped and fired by each piston alternately. The firing of the rear cylinder drives the piston and bit

Digitized by Google



MECHANISM OF THE DRILL. THE PISTONS, PISTON ROD AND BIT FORM ONE FREE ACTING, FULL FLOATING PIECE, WITH NO INTERRUPTION OF THE DIRECT BLOW.

forward, hitting the rock directly with all of the force of an explosion of gasoline. The front cylinder then fires and the piston is sent back to its first position again with the full force of an explosion, lifting the bit with extraordinary power. This operation continues indefinitely.

The pulsator is of the two cycle design (no valves used) and fired at each stroke of the piston. The cylinders are water cooled under the control of a self contained pump operating simultaneously with the drill. The fuel and oil container is attached to the side of the drill and is adjustable with respect to the angle at which the drill is set. When running, the lubrication of the working parts is automatic. The oil is fed into the gasoline and the cylinders, pistons and bearings receive the amount necessary.

The drill strikes 600 blows a minute with a bit 24 ft. long and drills hole from 1-1-8" to 2-3-4" in diameter at any angle. The cuttng speed is under the control of the operator but when running at full speed the drilling is as rapid as the air or steam drills of equal cylinder size and weight. It operates for 10 hours on less than 3 gallons of gasoline when drilling continuously at the highest speed. The cost of daily operation is estimated at $3.50 for drill runner. $2.50 drill helper. 75 cents for gasoline and 10 cents for lubrication, a total of $6.85.

It is stated that the drills have been thoroughly tested under many difficult conditions and in all kinds of work. One test involved 6 months' continuous run in competition with air and steam drills which were on the same work, won satisfactory results. At times during this run which was in the winter, the temperature was as low as 5 degrees above zero, but the gasoline drill did not lose a day. The drill is manufactured by the Rice Gasoline Rock Drill Co. with their principal office in Philadelphia.

Freight Car Troubles.

ON September 12, J. C. Fritts, master car builder of the Delaware, Lackawanna and Western Railroad, read a valuable paper before the Central Railway Club on the question of "Freight Car Troubles". Mr. Fritts called attention to the fact that up to fifteen or sixteen years ago it was the general practice to build cars with short draft timbers extending from the end still back to and butting against the body bolster. He points out that cars having draft arms and attachments of this type are entirely unfitted to sustain the strains they are subjected to in the present long trains. He suggests as a remedy the substitution for the present short draft arm, one of metal construction that will extend back of the bolster. Cars which will not warrant the expenditure necessary for such re-enforcement should either be confined to local service, where the owners would be the only ones to suffer the consequences of perpetuating such equipment, or they should be scrapped. A number of illustrations were offered showing the danger done to cars of faulty construction, several of which are herewith reproduced. He points out that careful investigation indicates that the stresses due to buffing and pulling have more than doubled in the past ten years so that cars built to meet conditions of ten or twelve years ago are not able to stand present day service.

Mr. Fritts discusses in the following manner the two methods used in re-enforcing old equipment:

First, for the older types of cars that we do not feel justified in going to the expense of providing with steel underframes, some roads are using a metal draft arm instead of the old oak timbers. These metal arms are being made of steel castings or standard rolled steel shapes riveted together in such a manner as to prevent the sills from spreading. I have tried both kinds and favor the steel casting for the reason that it withstands greater buffing stresses and can be moulded into one piece for each arm, making fewer parts for repair men to handle. The only extra parts needed are two or three tie plates riveted from arm to arm so as to make them both act together in receiving the shocks. Furthermore, the metal can be moulded in any shape, which allows of a distribution to give maximum strength. These arms, starting at the striking plate should pass back through and over the transom for a distance of at least 24 in. and have square butting ends to receive a good stiff compression timber secured to under side of center sill.

One of the latest designs of this type of steel casting draft arm is shown in Fig. 8. The compression timbers should be placed in line between the needle beams and from each needle beam to the butting face of the metal draft arm. They should also be fitted so tightly that a jack is required to get them in place, and they should be of a good stiff section at least 5 in. x 6 in. This type of re-enforcing, including a modern fritcion gear, can be applied to a car for approximately $135.00 and I feel sure it is all that is necessary for a very large number of the old cars that are now giving trouble.

The other method is to apply steel underframes complete at a cost of perhaps three times that of steel arms. This is pretty expensive but there are a large number of cars that will warrant this expenditure. Some of these underframes have been giving considerable trouble; therefore, we should look carefully into these troubles and de-

Digitized by Google

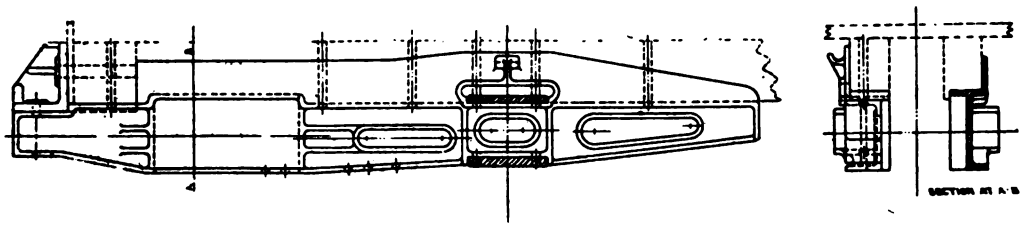


FIG. 8

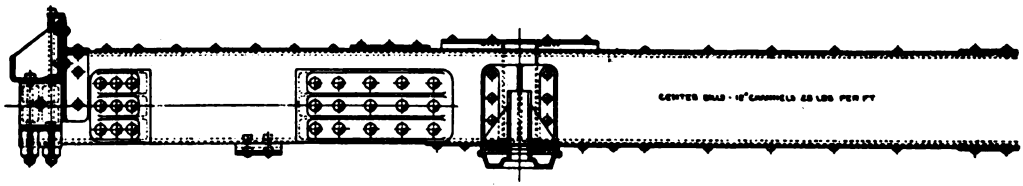

FIG. 9

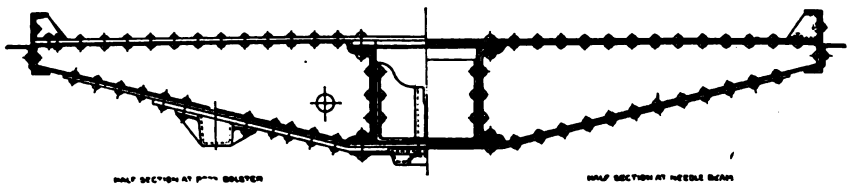

FIG. 10

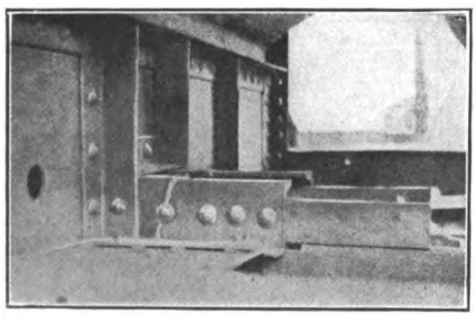
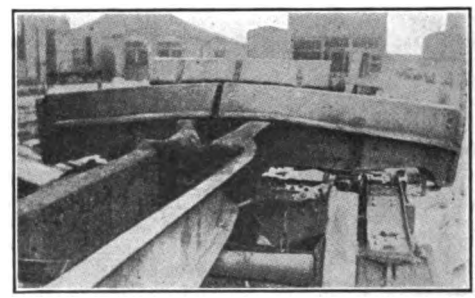
sign future frames with a view to overcoming them.

One of the latest types of steel underframe construction which it is believed has the greatest strength for a given weight is shown in Fig. 9 and Fig. 10. The center sills are continuous and the cover plates extend through the body bolsters as far as the construction will permit. Auxiliary cover plates at the center have been provided, both top and bottom. The body bolsters have been carefully considered. (A few extra pounds of metal at this point will bring good results). Securely riveted to the center sills is a top plate 20 in. wide, which will throw a great deal of strength into the center column over the centre plate, where the failures show we have the most work to do, and also acts as a gusset, strengthening the frame against lateral forces. The back lugs have been extended to the bolster and act as stiffners for the sills. The area of the cross section at the bolster is between 24 and 25 square inches, which we believe should be the minimum for a thirty-ton car. The center line of the coupler has been placed one inch below the neutral axis of the center members, this being a feature which does not seem to have been given proper consideration in the past. By keeping the force



A Very Common Failure Where Draft Arms are Riveted to Center Sills.



Steel Center Sills Buckled Within 12 Inch Back of Body Bolsters.

thrown against the car near the center of the draft sills, not only the liability of buckling but the breaking down at the bolsters is reduced to a minimum. Car designers should arrange the trucks and underframes so that this can be accomplished.

In connection with the above improvements, the use of friction gears is strongly recommended, it being shown that the number of broken couplers, knuckles, pockets, followers, springs and total failures are comparatively few with the use of friction gears, as compared with the use of the

Digitized by Google

various types of spring gears. In closing his paper Mr. Fritts offers as a relief to the present situation, the following suggestions:

First.—Re-enforcing the older types of cars that will not stand the expense of a steel underframe, with a long metal draft arm that extends through and over the body bolster. This in turn to be re-enforced, or backed up with good, heavy compression timbers.

Second.—On such cars as will permit of the expenditures, the application of a carefully designed steel underframe.

Third.—In all cases apply the draft gear that will destroy the greatest amount of shock with the entire elimination of recoil.

Fourth.—The adoption of a standard specification for the testing of draft gear to determine its shock absorbing capacity, and amount of recoil, before purchasing.

Fifth.—Substitute for the present wooden roof an all metal one as soon as it has been demonstrated what the proper construction should be.

Hydraulic Transmission in Railway Cars.

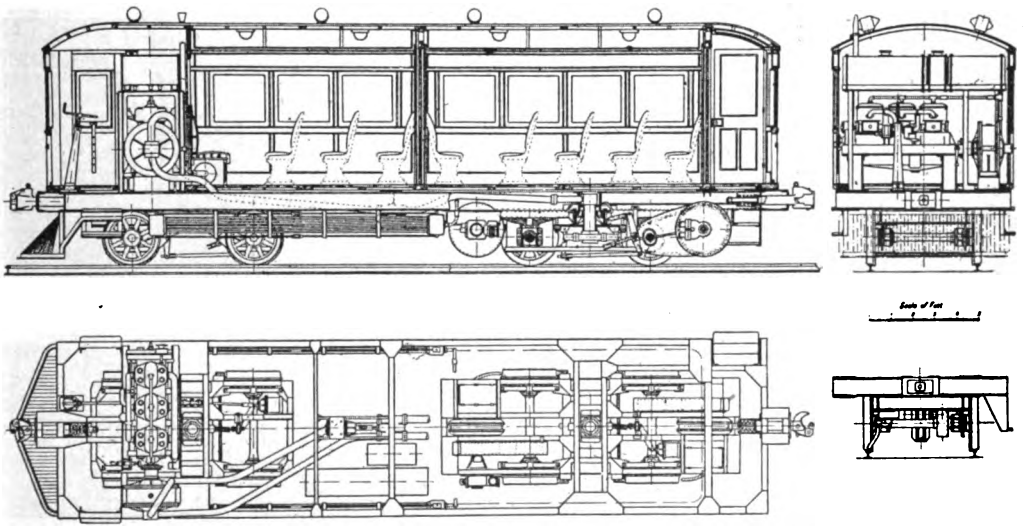
IN a recent article appearing in the "Engineer" the Hele-Shore System of hydraulic transmission combined with internal combustion engines, is discussed. Heretofore the great drawback to the use of the internal combustion engine for hauling heavy motor vehicles as compared with the steam engine, has been its lack of flexibility, which renders necessary the introduction of the step-by-step cog-box with its severe limitations. In the Hele-Shore system, the transmission of the power of the engine to the road wheels is affected by means of the Hele-Shore pump coupled direct to the engine and driving two hydraulic motors, operating by chain gearing the two axles of the rear bogie. A large variation of speed is obtained by this system and the direction varies according to the side of the axis to which the frame is moved. The oil under a pressure up to 2,000 pounds per square inch is transmitted from a central shaft through a heavy steel pipe to the two hydraulic motors on the rear bogie and the rotary motion of the motors is transmitted to the bogie axles by means of heavy chain gearing. As the speed of the oil motors is proportional to the amount of oil delivered by the pump a continuously variable and reversible gear is provided.

The liquid used in this system is ordinary lubricating oil, and thus all working parts are, it is claimed, perfectly lubricated, wear being reduced to a minimum. There are no piston rings, packing, or parts requiring renewal, and any oil which may leak past the plungers of the pump or motors is returned to the system by means of a small auxiliary pump. Safety valves are fitted on the pipe system.

Tests of the carriage on a siding of the Midland Railway at Burton-on-Trent sufficed to confirm the chief claims made for the hydraulic system. The principal advantage of this method of traction would appear to be the great starting effort which can be applied to the driving wheels without the shock which frequently acompanies the use of a clutch and spur gearing. The car was started, stopped, and reversed with ease by the manipulation of a hand wheel, which moves the guide frame of the pump.

The Keokuk Dam.

THE illustration at top of following page shows the great dam recently completed across the Mississippi River at Keokuk, Iowa. The construction of this giant monolith across the father of waters, has created a navigable lake for 65 miles back up the stream. The construction of the dam and its power houses have cost $27,000,000. The tremendous turbines which have been installed, the largest in the world, generate 200,000 H. P., 60,000 of which are transmitted to St. Louis. The dam proper is practically a mile in width extending from Keokuk, Iowa, to Hamilton, Illinois, the structure being 53 feet high keyed to the river bottom and consisting of 119 spans. The largest power house in the world has been built on the Keokuk side of the river.



RAILWAY MOTOR CAR DRIVEN BY GAS ENGINE AND HYDRAULIC TRANSMISSION GEAR

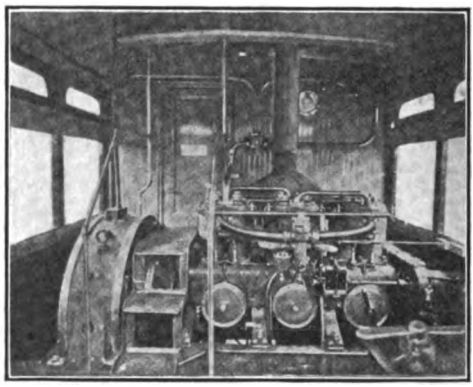
THE KEOKUK DAM WHICH STRETCHES ACROSS THE MISSISSIPPI RIVER FROM IOWA TO ILLINOIS. COST $27,000,000. AND WILL DEVELOP 200,000 H. P.

Electrical

The Dracar.

THE following illustrations show one of the "dracars" built for the Missouri, Oklahoma and Gulf Railroad, by the Drake Railway Automotrice Company. This car uses a gasoline engine to drive an electric generator whose energy is transmitted to motors geared to the axles. In other words, it is a gas-electric car which may be compared with the modern interurban trolley car but with trolley removed and power plant installed in the forward end. The power plant shown by Fig. 1 consists of a multi-cylinder gasolene engine direct connected to a 500-volt generator, shown on the left of the photo, both of which are mounted on one continuous subbase. The gasolene supply is caried in two tanks cross-connected and arranged so that either may deliver the gas to the carburetor. The cylinder water-cooling system is placed on the roof of the car, the hot water circulating through same. In winter a portion of the jacket water is circulated in the car heating system.

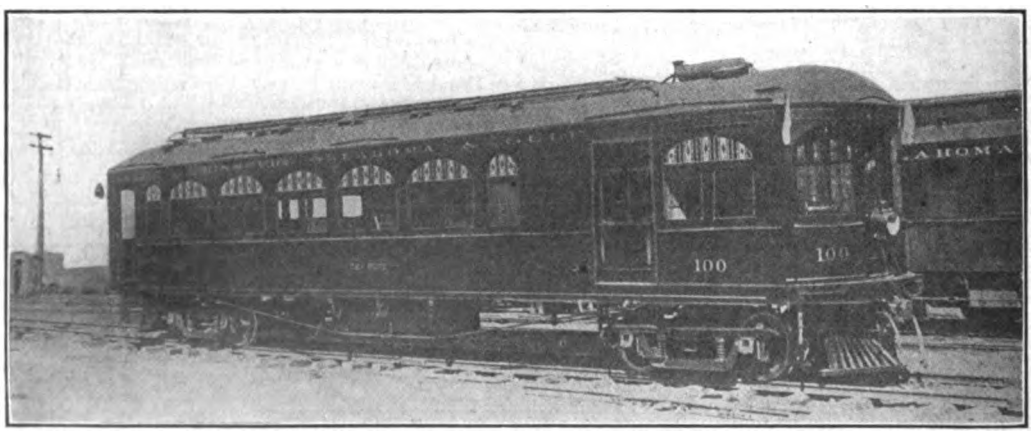
The power unit is remarkably simple and reliable. It is more of the automobile type of engine and can be easily cranked by one man, and mechanical starting means are unnecessary. One of the greatest advantages, and one which marks superiority is that perfect self-operation can be



PASSENGER CAR PEROLI GROUP, SHOWING GAS ENGINES AND ELECTRIC GENERATOR.

obtained in either direction. Since the power unit is at one end, it means that the unit can be controlled from a distant point, or the other end of the car.

The rear platform of each car is supplied with duplicate controller, air valves, etc. The controller is arranged in such manner as to give the motor-



GASOLINE-ELECTRIC DRACAR ON THE MISSOURI, OKLAHOMA AND GULF RAILWAY.

Digitized by Google

man control over the engine as well as the electric current generated by the group.

The car shown in the photograph is 56 feet over bumpers and nine feet six inches wide. The total weight complete is 65,000 pounds.

An Electric Cable Lift Bridge.

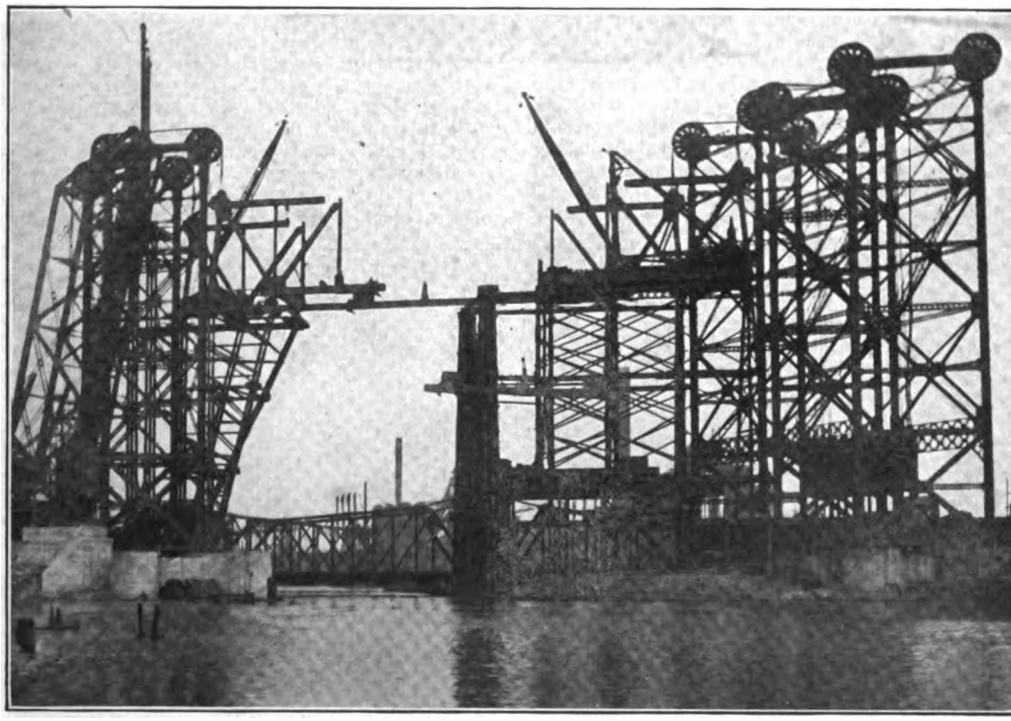
THE accompanying illustration show the constructed view of a new electric driven cable over Lift Bridge, at South Chicago. This interesting structure carries the four tracks of the Pittsburgh, Fort Wayne & Chicago Ry., and will replace a double track swing bridge. It consists of two double track vertical lift cable operated bridges of the Waddell & Harrington type placed together but electrically operated independently. They measure 210 feet long, crossing the stream at a skew of 50 degrees and giving a channel 140 feet wide with the clear headway for shipping of 120 feet.

The spans are being erected on falsework at this elevation, an opening 80 ft. wide being left to enable vessels to pass. It may be stated that the east tower of the north span was erected with a guy derrick designed specially for this work with an 85 ft. mast and a 70 ft. boom. This mast is built of two 24 inch 80 lb. I beams, with an 18 inch 55 lb. I beam placed horizontally between their webs as a separator and with lacing over the flanges of the 24 inch beams. The boom is built of a pair of 18 inch 55 pound I beams, with lacing over the flanges and there are eight guys of 1 1-4 inch plow steel rope and the spread of the guys is only 16 ft. from the foot of the mast.

As soon as the tower was completed, the adjacent east tower of the south span was erected by a 68 ft. trussed wood boom, 16x16 inches and one of the tower posts of the south span was utilized as a mast, the boom seat and topping lift brackets being of special design and riveted to the tower post. The swing bridge of the Lake Shore & Michigan Southern Ry., is parallel with an only 25 ft. from the lift bridge and its end swings under the north span of the latter and it was necessary to build the falsework so as to avoid interfering with this bridge. This was done by placing in the falsework two 103 ft. girders on the side nearest the swing bridge, and three top chords lengths of the span side by side on the side furthest from that bridge. The girders and chord sections were all at an elevation of 40 ft. above the water which was sufficient to clear the swing bridge when open. Upon these temporary steel spans was erected the upper part of the falsework for the trusses.

A timber knee-brace, on the west side of the river resting on the pier and inclined outwards over the channel will support two panels of the truss (52 ft.) on the longer side of the skew and one panel (26 ft.) on the short side. The bottom chord connections of two of the 70 ft. end sections of the chords will come over the 80 ft. ship channel which is kept open for navigation, and the cantilever ends of the chords will be supported by a mule traveler on the main falsework while the connection is being made across the channel.

The cables slung across the river from the 15 ton sheaves on the towers will help to support the chords till the truss is completed. The erecting force averages 30 men. The weight of steel is about 550 tons in each of the four towers and 1100 tons in each of the two spans. The heaviest single pieces handled weighed about 60,000 lbs.



THE STEEL GUY DERRICK SHOWN IN THE EXTREME LEFT OF THIS PHOTOGRAPH, WEIGHS COMPLETE 30 TONS AND HAS A 70 TON CAPACITY BOOMED OUT 30 FEET. THE BOOM TO THE RIGHT OF IT SET 122 TONS OF STEEL IN SEVEN HOURS.

Digitized by Google

Terminal Improvements

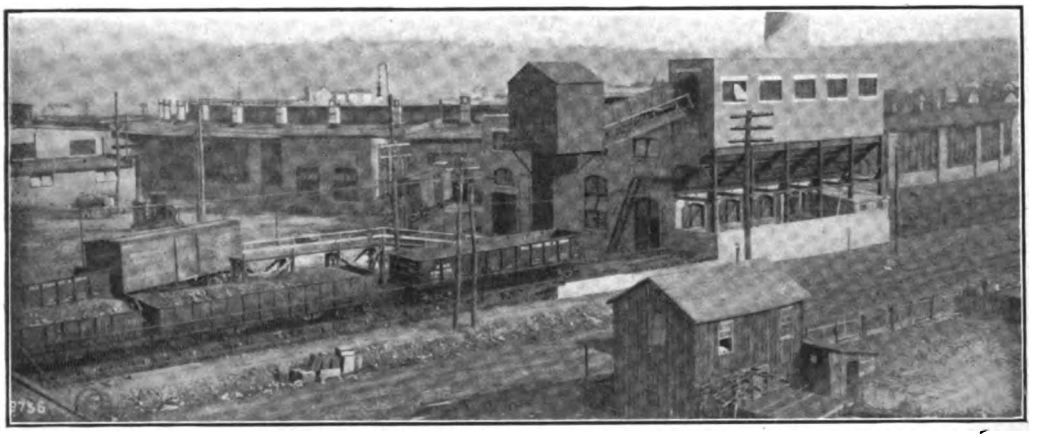
The Baltimore & Ohio Improvements at Cumberland, Md.

THIS terminal, referred to herein, is situated at the foot of the eastern slope of the Allegheny Mountains near the convergence of the lines of the Baltimore & Ohio from the west and is a terminus for the district lying west of Washington and Martinsburg. Both passenger and freight traffic through this point is extremely heavy. Practically all of the locomotives used in this territory are of the heavy Mallet and Mikado types in freight service and the heaviest type of Pacific in passenger service.

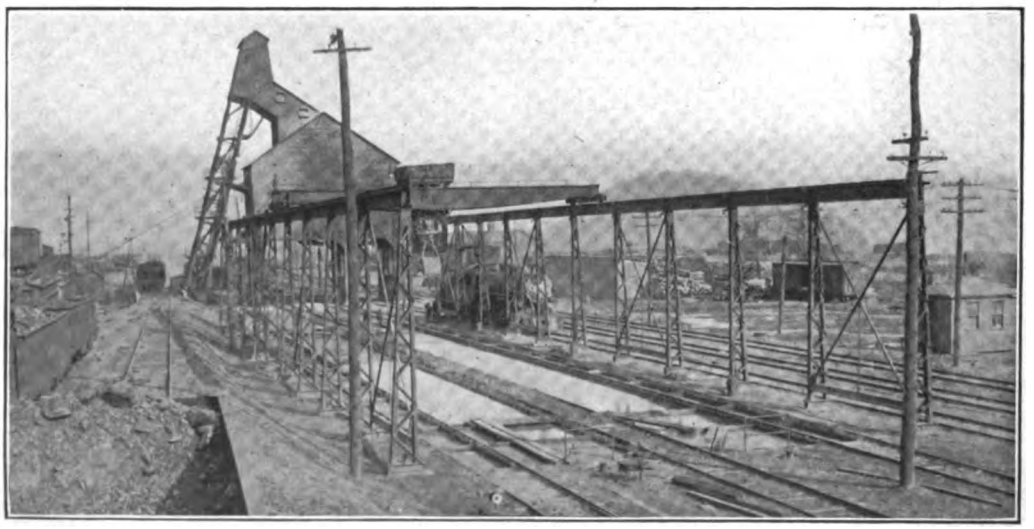
The old engine terminal had become entirely inadequate to properly take care of the heavy locomotives. This situation was rendered more acute by the extremely cold weather that prevails for relatively long periods. Sufficient ground space for the new terminal was available alongside of the old facilities. The improvements consisted of a round house with a 100-ft. turntable, a double cinder pit, a reinforced coaling station, a sand house and a small power house, all conveniently arranged and embodying an up-to-date locomotive terminal with buildings and other facilities of permanent construction.

In order to accommodate the large Mallet locomotives the length of the roundhouse was made 110 ft. There has been constructed at this time 31 stalls and space is left for further extension. A deck type turntable 100 ft. long is used. The building is constructed with brick walls on concrete foundations with timber roof posts and beams supporting a wooden roof. The rear wall of the house is made up of brick pilasters with broad window spaces between with top and bottom sash counterbalanced with each other. The roof line is broken at the first row of posts near the front of the building so as to give a row of sash with narrow vertical louvre over each stall to provide light and ventilation.

On account of the types of engines handled consisting principally of Mallets, Mikados and large Pacifics, the engine pits are made 88 ft. long with side pit walls for a distance of 40 ft.



BALTIMORE AND OHIO'S LOCOMOTIVE TERMINAL AT CUMBERLAND, MD.



THE CINDER PIT, CRANE AND RUN-WAY AT THE BALTIMORE AND OHIO'S LOCOMOTIVE TERMINAL AT CUMBERLAND, MD.

Digitized by Google

on the inner end made of sufficient width to provide bearing for jacking. The pit walls are extended 12 ft. outside of the house to prevent track settlement. To facilitate handling repairs to Mallet engines, twin driving wheel drop pits, serving four stalls, were provided. In addition two stalls are provided with track wheel drop pits. These pits are furnished with hydraulic pneumatic jacks of 30 tons and 15 tons capacities respectively. All pits are drained by a special sewer system which returns the water to a central reservoir from which it is taken for use in the boiler washing system. Each of the stalls is provided with a smoke jack made of Trammite supported on a wooden frame with hoods 4 ft. x 12 ft. long.

The floor wearing surface is one-half of creosoted wooden blocks 3 inches deep and one-half of mastic rock 1-1-2 inches thick. Both types of floor are underlaid with 6 inches of concrete. The use of these two materials will give an effective test of their relative merits.

Closely adjacent to the engine house and connected to it by a covered passageway, carrying a track connecting to one of the stalls of the roundhouse, is a machine shop 70 ft. x 140 ft. Machine tool equipment is installed for taking care of light running repairs including a driving wheel lathe. The machine tools are driven by electric motors.

At the west end of the shop in a separate room toilet facilities for the men are provided. At the east end of the Machine Shop and attached to it is a two-story office building about 33 x 64 ft. This is a brick building divided by lath and plaster partitions into rooms for the Master Mechanic, Road Foreman of Engines, Roundhouse Foreman, Storekeeper and their clerks, also the Engine Dispatchers' room with train board.

The cinder pit is located between the coaling station and the engine house. This is a double pit of the submerged type having an overhead traveling crane with a grab bucket. The cinder pit stands practically full of water at all times. Into this the cinders are dumped and loaded by means of the grab bucket into cars standing on a track between the two ash pits. About 120 engines are handled over this pit daily. The economy of loading the cinders may be judged by the fact that one man working during the daylight hours only is able to load all the cinders.

The coaling station is located, as stated, in advance of the cinder pit. The structure is of reinforced concrete with bunker capacity for 600 tons of coal. The bunker is divided into four bins to handle three sizes of coal. Run-of-mine, coal crushed for locomotives equipped with stokers and special coal for passenger locomotives. As the greatest consumption is of run-of-mine two of the bins are used for storing this size.

It is arranged to deliver coal onto locomotives on four tracks passing beneath and along one end of the station. Run-of-mine coal can be taken on any one of these tracks, while on two tracks passenger coal can be taken and on another the stoker coal. The locomotive coal is received on a track passing one end of the station, the coal being dumped from the cars into a concrete pit and elevated by an inclined balanced skip hoist. The two skips are of 5 tons capacity each and capable of elevating 125 tons of coal per hour. The electric motor operating the hoist is controled automatically.

Provision is made for overhead storage of 20 cubic yards of dry sand with suitable pipes for delivering sand to the locomotives on any one of the four tracks.

Green sand storage of about 1200 cubic yards is provided in a sand house nearby the coaling station. The sand is dried by steam driers and elevated into overhead storage bins by compressed air.

All buildings are completely encircled by a 6-inch fire line supplying fourteen 4-inch, two-way fire hydrants. An outfit of hose is stored in suitable hose houses in strategic locations. This system is supplied by the fire pump in the power house having a capacity of 700 gallons per minute on which steam is kept at all times.

About 3000 ft. of water pipe varying in size from 10 inches to 14 inches was laid for supplying 3 penstocks erected for supplying engines passing to and from the new engine house. This was connected to existing water tanks and a 12-inch branch furnishes the power house with water.

The work was designed and constructed by Westinghouse Church Kerr & Company, of New York, under the direction of Mr. M. A. Long, Asst. to Chief Engineer as representative of the Railroad Company.

Interstate Commerce Commission

Report on the New Haven Wreck.

THE Commission's report which has been issued as the result of its investigation of the rear end collision at North Haven, Conn., on September 2nd, virtually declares that "man failure" all along the line was the cause of the disaster. In its report the Commission blames the crews of the wreck trains for lapses and scores officials and directors for "inefficiency of management." The new executive head of the road, Mr. Howard Elliott, is, of course, not held to the slightest degree responsible for what occurred, as his official connection with the system practically begun on the morning of the disaster.

The Commission sharply criticises both officials and directors for the promulgation of regulations which were permitted to become practically dead letters and for not seeing to it personally that operating conditions were what they should have directed them to be. The report also points out that antiquated signals and old wooden cars unsuited by construction for such traffic as they were expected to accommodate, were in use at the time. While it is hardly fair to severely criticise the New Haven on account of the employment of wooden passenger cars

Digitized by Google

inasmuch as hundreds of other roads in the country are still operating under similar conditions, it is plain that the demand for the employment of steel cars is becoming more general and emphatic each day, and that public opinion will force the railways to employ them as quickly as old equipment can be disposed of. Commissioner McChord indicates the result of a similar recent accident at Tyrone, Pa., in which the equipment was all steel and in which none of the passengers were killed, as an object in favor of the use of steel equipment.

While the accident was largely the result of disobedience to orders, the Commission blames the managers of the road, who it holds, employ no proper method to guarantee obedience to its rules and regulations. For this reason the immediate adoption of an adequate system of superintendence and supervision which will give those in authority definite and positive information as to whether or not the safety requirements and rules of the railroad are observed, is demanded.

The report points out that at a meeting of the directors of the New Haven, after disasters at Bridgeport and Westport, a resolution was adopted directing President Mellen, then at the head of the system, to leave nothing undone "which in the judgment of himself and his associates, will conduce to greater safety in the operation of the road, and that there shall be no limitation placed upon the installation of signals, safety appliances, or anything else which will improve the safety of passenger travel upon this company's lines."

There the directors stopped, the report says. They did not see to it that their resolution was carried into effect.

"This typifies the whole situation," declares Commissioner McChord. "They assumed the vote was self-enforcing.

"The president, general manager and superintendents issued orders that all rules should be obeyed and that employes should take all precautions for safety.

"But no intelligent system was devised by which to ascertain when rules were disobeyed.

"Rules were disobeyed largely and only a small proportion of these violations was made the subject matter of reports to officials.

"Of some of the rules, as has recently been said by the general manager of this railroad when he issued new ones in their place, there had been 'convincing demonstration' of their inadequacy.

"Dereliction of duty by those who are charged with the making and with the enforcement of safety regulations cannot fail to weaken respect for all rules and to render nugatory to a large extent all efforts to maintain effective discipline. Rules that are not intended to be enforced have no proper place in a railroad company's code of regulations, and when the operating officers of a railroad permit rules which have been established to secure safety to be violated with impunity, they cannot reasonably expect to escape responsibility for the consequences of such violations."

The report contains no recommendations, except by inference, and no orders, as the Interstate Commerce Commission is without authority to control or supervise the operation of trains.

Tyrone Wreck Report.

IN the Commission's report on the rear-end collision between two passenger trains on the Pennsylvania Railroad on July 30th, at Tyrone, Pa., which resulted in the death of one employe and the injury of 126 passengers, it is held that the accident was due to the failure of three men on locomotive to observe and heed the signal. The trains were being operated under the automatic block system which was in good working condition, and the Commission holds there was no excuse for the failure of all three men to observe the signal.

"A consideration of accidents of this character," says the report, "leads inevitably to the conclusion that even the most complete and modern system of fixed signals is not adequate and calls attention to the necessity of automatic train stopping devices."

The report says that "the substantial construction of the modern steel cars of these trains is, without doubt, the reason that none of the passengers were killed."

Report on Pacific Coast Wreck.

CARELESSNESS of a flagman, disregard of regulations by a motorman, and "failure of the railway company to provide an adequate method of operation to insure the safety of trains," were the causes, according to a report of the Commission of the rear-end collision on the Pacific Electric Railway, near Los Angeles, Cal., on July 13th, in which fourteen passengers were killed and 200 injured.

The report showed that the division on which the accident occurred was operated by time card, "without signals or orders and with no means of spacing trains except by vision." In the case of this accident the flagman of the train in advance failed to notify the rear train and the motorman of the rear train failing to control his speed.

The report of Inspector Belknap severely criticized the railway company for not providing safe methods of operation and suggested the installation of an automatic train control system, in successful operation on other electric lines.

Extension Granted on Express Rates.

AFTER giving supplementary consideration to the express decision, the Commission has finally acceded to part of the request of the express companies and extended the time within which the reduced rates are to go into effect. The matter has been pending before the Commission for some time, and has been the subject of conference, but it was only at the last moment that an agreement was reached to extend the time.

The reduced rates were to have gone into effect on October 15th, but it was conclusively proven to the Commission that the express companies find it impossible to print their new tariffs by that time. Wherefore it has been agreed to give the companies until December 1st for compliance with the decision issued last spring. The notice issued by the Commission in this connection reads as follows:

"The Interstate Commerce Commission has extended the effective date of the order in the

Digitized by Google

above-entitled proceeding from October 15, 1913, to December 1, 1913.

"The Commission declines to revise the scale.

"Upon showing that further time for preparation of tariffs is necessary and that work is being prosecuted with diligence, application for further extension is granted.

Hearing on New Forms of Railroad Reports.

WILLIAM J. MEYERS, statistician of the Interstate Commerce Commission, has issued a notice to carriers in which he says that the Interstate Commerce Commission has set for hearing at 10 A. M., October 27, 1913, at its hearing room in Washington, D. C., the matter of revision of report forms used by it in receiving annual reports of carriers and carrier corporations within its jurisdiction. In this connection a tentative draft of a revised annual report form will be submitted for discussion at that time. Certain matters in this tentative draft are incomplete, one of which is the subject of apportionment of operating expenses to the class of service in which incurred; another is the matter of returns to be required regarding service and compensation of employes. While suggestions regarding these matters are particularly invited, the entire report will be subject to review and criticism. All persons interested in the subject are invited to attend the hearing above mentioned, and to present their views to the Commission.

Valuation Districts.

THE Commission has announced that each of the five districts into which it has divided the country to make a physical valuation of the railroads contains approximately 50,000 miles of railroad. The title of each district, the city designated as headquarters and the States and territories included in each are as follows:

Eastern.—Washington, D. C.; Connecticut, Delaware, District of Columbia, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, North Carolina, Pennsylvania, Rhode Island, Vermont, Virginia and West Virginia.

Southern.—Chattanooga; Alabama, Florida, Georgia, Indiana, Kentucky, Mississippi, Ohio, Panama, Porto Rico, South Carolina and Tennessee.

Central.—Chicago; Arkansas, Illinois, Iowa, Louisiana, Michigan, Minnesota and Wisconsin.

Western.—Kansas City; Colorado, Kansas, Missouri, Nebraska, North Dakota, Oklahoma, South Dakota and Texas.

Pacific.—San Francisco; Alaska, Arizona, California, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington and Wyoming.

Order in Import Rate Case.

THE Commission has ordered that the railroad rates on imports westbound from New York and Boston, shall be the same for two years.

This ends the import rate case, which has dragged along for several years and in which the two cities fought for advantage.

Commission Refuses to Re-Open Connecticut Commuters' Case.

THE Commission has refused to re-open the Connecticut commuters' fare case as asked by the Connecticut Commuters' League. The Commission, three months ago, fixed commutation rates between New York City and Connecticut at eight per cent less than former rates, and the Commission believes these rates are reasonable.

Commission Objects to State Interference.

THE Commission in a brief to the Supreme Court in the so-called Shreveport cases, strongly contends for power to prevent discriminations against inter-State commerce by State Railroad Commissions.

The conflict between Federal and State jurisdiction in the regulation of railroads is sharply drawn in these cases, which grew out of orders by the Texas Railroad Commission, alleged to be discriminatory in favor of Houston and Dallas, Texas, and against Shreveport, La.

The Inter-State Commerce Commission ordered the Houston, East and West Texas Railway Company and the Texas and Pacific Railway Company to remove the discrimination resulting from the exaction of rates on traffic from Shreveport to Texas points that were relatively greater than the rates maintained on like traffic to the same destinations from Dallas and Houston. The rates on traffic from Houston and Dallas to other Texas points were made by the Texas Railroad Commission and the railroads contest the power of the Interstate Commerce Commission to consider these intra-State rates in connection with inter-State commerce.

P. J. Farrell, the Commission's solicitor, holds, however, that the purpose of the Texas State rates was to discriminate against inter-State commerce and that Congress has clothed the Commission with power to prevent this. The proviso of the Interstate Commerce Act which exempts intra-State traffic from the regulation of the Interstate Commerce Commission refers, the solicitor contends, to traffic wholly within one State, which does not affect any other State.

To construe the law otherwise, Mr. Farrell continues, would inevitably have the effect of clothing the individual States with control over a very large portion of the inter-State commerce of the country and of rendering impossible proper regulation of the remaining portion of that commerce.

Boston and Maine Petitions for Increased Rates.

COMMISSIONER PROUTY, at Boston, on September 23rd, heard the petition of the Boston and Maine for an increase in transportation charges. The Company wishes to revise its tariff so as to augment its gross receipts by about ten per cent.

The road's case was outlined by its general solicitor, Edgar J. Rich, who said that the road was confronted by a serious situation. For July, 1913, the net corporate income was only $54,560, as contrasted with $407,302 for July, 1912. For September the decrease in gross operating revenues to the fourteenth of the month had been at the rate of $9,500 per day.

Digitized by Google

This financial condition was due, Mr. Rich said, to the great increase in the rate of wages and the cost of hiring freight cars and the handling of traffic which resulted from a congestion due to a moderate increase in business, and a large increase in interest charges. The advance in wages, he said, since 1912, amounted to about $3,000,000 a year or the equivalent of a seven per cent dividend.

Counsel said that nearly $31,000,000 was imperatively needed during the next two years for equipment, as follows: 10,000 freight cars, $12,000,000; 100 locomotives, $1,400,000; 100 steel passenger cars, $1,200,000; improvements on account of safety, $7,582,000, and improvements which would result in operating economies, $8,670,000.

Higher Commodity Rates for Missouri Valley.

SUBSTANTIAL increases in certain commodity rates between Missouri River points, Kansas City, Omaha, St. Joseph and Sioux City, will be permitted to go into effect as the result of a decision issued by the Commission. It was held that the advanced rates will not result in excessive revenue to the railroads, and when certain modifications shall have been made as agreed between the roads and the shippers the Commission's order of suspension will be vacated.

The decision was written by Commissioner McChord, who pointed out that while the law casts upon the roads the burden of showing that the increased rates are reasonable, it is but fair that parties at whose instance suspensions are ordered should present to the Commission all facts, circumstances, conditions or reasons, which, in their opinion, tend to show that the increases should not be allowed.

Lake Traffic and the Panama Canal.

IN compliance with the Panama Canal Act of 1911, the Pennsylvania Railroad has made application to the Commission for permission to continue its ownership and operation of steamship lines on the Great Lakes. The Panama Act requires all railroads to dispose of the ownership of competing water transportation lines, excepting where the Interstate Commerce Commission gives them permission to continue in control of such lines.

Private Car Investigation Extended.

THE Commission has directed that "all individuals, firms, companies and corporations owning or operating cars and other vehicles and instrumentalities and facilities of shipment or carriage of property in interstate commerce" be made defendants in the commission's investigation of private car lines and the allowances paid to them by the trunk line railways.

The private car line investigation was begun by the Commission more than a year ago on complaint that the operation of such car lines was unreasonable and discriminatory and that the allowances to them by the trunk lines were excessive. By the terms of the first order only the railways were made respondents in the proceedings. By the new order the owner of every private car line is brought directly into the case.

The intimation is abroad that information already developed by the inquiry is of such a character that it may warrant not only a positive order by the Commission against private car lines, but probably action by the Department of Justice.

Steel Car Data of Pullman Company.

OFFICIALS of the Pullman Company are preparing figures regarding the number of wooden and steel cars in service in the United States for submission to the Interstate Commerce Commission, which presented a request for such figures following the latest wreck on the New Haven road. An official of the Pullman Company states that his company has manufactured nothing but steel cars for the last three years. "We are making them as rapidly as possible," he says, "and are supplying them to all the railroads, automatically retiring the wooden cars."

New Defect in Steel Rails.

IN a report recently made public, the Commission recommends a searching investigation into the question of steel rails. The Commission's experts have located a new defect in rails known as "transverse fissure." Commenting on this H. W. Belknap, chief inspector of safety appliance of the Commission, says that "the insidious character of these fissures and their menace to safe travel by rail fully justify the conclusion reached in previous reports that there is an absolute necessity of making a complete investigation of track and rail conditions to determine the effect thereon of the recent types of locomotives and cars with their greatly increased wheel loads."

The report says: "this condition is extremely grave," and quotes James E. Howard, engineer-physicist of the bureau of standards, as follows:

"No method has been found capable of locating incipient interior fissures which it should be remarked, do not present oxidized surfaces. Primarily the formation of a transverse fissure is the result of an overload for that particular rail from whatever point the subject is viewed."

The Commission will invite representatives of the railroads and manufacturers of rails to confer with the experts of the Commission to see if something cannot be done to remedy this particular defect.

Samples as Baggage.

THE Commission has recently issued a ruling to the effect that sample baggage carried for display may be checked by a passenger over a railroad but such samples may not be sold or distributed at the point to which they have been checked as baggage.

"Such articles," the Commission holds, "may lawfully be sold or distributed at any point to which they have been shipped as mail, freight or express, and they may lawfully be shipped from a point to which they have been checked as baggage for use as samples or for display."

Digitized by Google

TRAFFIC.

Traffic Conditions in the South.—While the railroads of the Middle West and Northwest are likely to suffer in tonnage records on account of the failure or partial failure of some of the grain crops, conditions throughout the Southeast are unusually good and the railroads of that section expect a heavy traffic for the fall and winter. Shippers are being called upon to assist them in providing an adequate car supply as a heavy demand is anticipated. Steps are also being taken to provide for the more expeditious handling of cars at terminals and transportation points. Shippers can render assistance by loading and unloading cars as promptly and quickly as possible, thus avoiding unnecessary detention and also by loading cars to their full capacity. Trade and commercial bodies should urge upon their members the importance of securing the maximum efficiency in the employment of cars.

LEGISLATION.

Tariff Bill Becomes Law.—On October 3rd, at 9 P. M., President Wilson signed the tariff bill, thus putting into effect one of the most far reaching revisions of tariff rates and revenue laws ever enacted in this country. The bill which was passed four years after President Taft signed the Payne-Aldridge law, is the result of more than nine months of work in Congress.

A new income tax, applying directly to the incomes of citizens; the abolition of all tariff on scores of items of immense importance to American industry and American consumers, and a heavy reduction of tariff rates on most of the articles in general use in this country, are its chief features.

While certain portions of the new law do not take effect at once, most of its provisions and almost all the direct tariff reductions do.

The Federal Government has been spending nearly a billion dollars a year, and the new tariff law will raise less than one-third of that sum. Recent estimates by tariff experts in Congress predict that the rates will raise $249,000,000 a year, and that the income and corporation taxes will raise $122,000,000. The remainder of the Government's great income is made up principally of internal revenue taxes and postal receipts.

The income tax probably will bring the new tariff law most forcibly to the attention of citizens.

A brief summary of the new tariff law as prepared for the Senate follows:

Average percentage of tariff rates as compared to the value of all imported merchandise—Old law, 37 per cent; new law, 27 per cent.

Value of annual imports added to the free list, $147,000,000.

Estimated revenue from all import rates—Old law, $305,000,000; new law, $249,000,000.

Estimated revenue from corporation and income, taxes—Old law, $37,000,000; new law, $122,000,000.

Altogether consumers in the United States probably will receive from abroad free of all tariff more than $1,000,000,000 worth of merchandise during the next year.

During 1912 the amount of "free imports" was more than $880,000,000, and when the tariff is entirely removed from wool, sugar, iron ore and cheap iron and other important items the total is expected to increase notably. Under the old law more than 53 per cent of all goods brought to the United States from all parts of the world paid no tariff, and that proportion will be increased by the new law.

The free wool provision of the new law takes effect December 1, 1913; the free sugar provision May 1, 1916.

Trespassing Laws More Needed than Steel cars.—Slason Thompson, of the Bureau of Railway News and Statistics at Chicago, has recently prepared a statement showing how much more effective in the conservation of human life would be the passage and enforcement of adequate trespassing laws, than the equipment of the entire transportation plant with steel passenger cars. In arriving at this conclusion, Mr. Thompson shows that of the total number of fatalities charged to the United States railroads in twenty-three years, nearly 54 per cent applied to trespassers, 25.7 per cent to employes through their own fault or mischance, 9.5 per cent to other persons through their own fault or mischance, 7.1 per cent to employes in accidents to trains, 2.2 per cent to passengers through their own fault or mischance, and only 1.7 per cent to passengers in accidents to trains. In other words, covering a period of twenty-three years, 91.2 per cent of all deaths on United States railroads occurred through the fault or mischance of the victim and for which the management or equipment could not be held responsible, while only 8.8 per cent were due to accidents to trains and nearly 50 per cent of these deaths were traceable to the negligence or carelessness of the individual who lost his life.

In concluding his analysis, Mr. Thompson says: "So long as legislators, commissions and critics rivet their attention on steam cars, which may cause, but never defer, a collision or derailment, the tale of railroad fatalities will grow along the line of the greatest percentage of causes."

Passenger Car Replacement Possibilities.—The "Wall Street Journal" asserts that there is probably no occasion to be alarmed over the latest bill introduced in Congress to compel railroads to substitute steel passenger cars for present wooden cars. Representative Allen, of Ohio, is the author of the measure, which aims to compel railroads to replace wooden passenger cars with cars of steel construction, and provides a penalty of $1,000 for each wooden car operated after January 1, 1918.

On April 15, 1911, Representative Esch, of Wisconsin, introduced a bill to prohibit, after January 1, 1912, the construction or use for the first time of any wooden passenger service car. A penalty of $1,000 for each violation was also one of the provisions.

On June 17, 1911, Mr. Talbot, of New York, introduced a similar bill to prohibit the use of wooden passenger service equipment after June 1, 1915, and also providing for a penalty of $1,000 for each offense.

The constant repetition of attempts to pass bills of this character foreshadow a successful effort in the not distant future. But desirable as substitution of steel or steel underframe for wooden construction would be, it is not likely

Digitized by Google

that this desideratum will be realized for many years.

In the first place, the total annual steel passenger car capacity of the four big equipment companies is 3,500. This includes the Pullman, American, Standard and Pressed steel car companies. In 1910 there were 47,000 passenger cars in service on all the railroads in the country. At the present time there are something over 55,000. A very small proportion of these are now of steel construction. Five thousand would be a very liberal estimate of the number of steel passenger cars in use. There would, therefore, remain 50,000 wooden cars to be replaced. At the rate of 3,500 a year, which is the present forced capacity of the equipment companies, it would take fourteen years to replace the present wooden passenger equipment, unless capacity of the plants is very largely increased.

The cost of this replacement would be in the neighborhood of $600,000,000. In 1911, the Committee on Relation of Railway Operation to Legislation estimated it would cost $630,000,000 to replace wooden cars with steel. This, in itself, would not seriously tax the railroads. It would mean raising $150,000,000 a year, which they could probably do. It is not unlikely that if the railroads were compelled to make this substitution in a limited period of years, they would find it necessary to subordinate many other more pressing and important improvement and betterment needs during the process. Furthermore, steel passenger cars would earn no more than wooden cars, although cost of maintenance and damage might be materially reduced.

LEGAL.

Dealing Out Justice to Swindlers of the Railways.—Fines totalling $11,000 were inflicted and paid by Harry C. Shimer and Adolph Fortgang of the firm of R. B. Shimer & Co., of New York, who plead guilty to certain counts in indictments brought against them in the United States District Court, Southern District of New York, for bribing railroad employees to furnish names of consigners shipping to other consignees and for obtaining payment from the railroads of false claims for loss and damage on shipments of eggs. In passing sentence the court, in part, stated as follows:

"Mr. Shimer and Mr. Fortgang, both, I will say to each of you, if I should actually do what I ought to do in this case, in order to thoroughly vindicate the law and make an example for others, one which would have a salutary effect in deterring others from committing this and like offenses, the Court would fine you a sufficient amount to take from you and this firm, every cent of your ill gotten gains, and then, in addition to that fine add a long term of imprisonment and in this way all who are disposed to offend against the law and to indulge in grossly illegal practices to enrich themselves at the expense of others, would be taught a lesson, the existence of the law and that punishment is sure to follow.

"And now I want to say to you further, and to each of you, that so far as is within my power, I will see, and I know that the United States Attorney and his able assistants will see, and that the United States attorneys wherever they are and wherever an offence might be indictable, will see to it—and it is a warning and not a threat—that if you should offend against the law again in these respects, you need not expect to escape with a fine, for surely the penalty will be not only a heavy fine, but a long term of imprisonment, justly earned by a repetition of such an offence as this."

STATE COMMISSIONS.

Alabama.—The Alabama Railroad Commission has ordered the South & North Alabama to put into effect September 14th, a passenger rate of 2½ cents a mile. The road is operated by the Louisville & Nashville.

California.—On every station bulletin board and in all of its freight offices, the Southern Pacific Company is posting printed copies of the letter issued by the State Railroad Commission calling upon shippers to promptly load and unload freight cars to prevent a shortage. Railroad officials declare that the beneficial results from appeals sent out by the various commercial bodies in the State are already evident, but carelessness or delay may precipitate a stringency that would work immeasureable harm to the growers who wish to market their products.

Says the letter:

"To all Shippers and Receivers of Freight:

"During the next few months the preponderance of traffic will be outbound from California, thereby lessening the number of cars which will be available for local traffic.

"The Commission respectfully requests that shippers and receivers of freight in carload lots use every effort to load and unload cars in less than forty-eight hours free time permitted under our demurrage rules.

"Shippers are also requested to load cars to full capacity, which will materially reduce the number of cars needed to handle their business.

"Railroads are requested to handle promptly, when billed, all carload shipments and to move empty cars to loading points without delay; also to repair promptly for service all crippled and bad order cars.

"The Commission feels that a co-operation of shippers and railroads will assist materially in preventing a serious car shortage."

The State Railroad Commission, acting on the complaints of travelers, has ordered the Pullman Company to appear before it November 19th, and explain its "practices, rules and regulations."

Rates will not figure in the event, but its scope in other directions will be wide. These are some of the things the committee wants to know:—

How much the company depends on passengers' tips in figuring porters' wages.

Why upper berths are pulled down when not occupied, making lower berths stuffy and cramped.

Why the answer "no lowers left" so often proves to have been a mistake the next morning.

Why a passenger cannot get his berth made up when he wants it, but must await the porter's pleasure.

Digitized by Google

Why berths so often are sold to more than one passenger with resulting confusion and annoyance.

Connecticut.— The Public Utilities Commission has sent a communication to General Manager, C. L. Bardo, of the New York, New Haven & Hartford, concerning banjo signals, suggesting the advisability of immediately installing for the information and guidance of engineers, conspicuous yellow signs to be placed 2,500 feet in advance of all banjo signals, which are not at the present time equipped with distant signals, until such time as the new automatic signals are installed.

Georgia.—The Brinson Railway Company has asked the State Railroad Commission for permission to issue $2,563,500 of refunding bonds. The officials of the company admit that they do no expect to place that sum in bonds on the market, but they hope to use half the issue as security for $1,250,000 worth of two-year-old gold notes to be paid within two years at the rate of six per cent. The bonds, if allowed, are to be for thirty years and to bear six per cent interest.

Kansas.—Henderson Martin, chairman of the Utility Commission, has sent notices to the commissions of Iowa, Minnesota, Nebraska, Oklahoma, Missouri and North and South Dakota, asking them to join in a movement intended to prevent a proposed increase in freight rates on manufactured products shipped from Eastern States to the Middle West.

Missouri.—The Public Service Commission has served upon railroads an order which provides that where a tariff contains increases or reductions a detailed statement must be filed with the Commission giving the reason for such reductions or advances at the time the tariff is submitted for the approval of the Commission. The order contains the rules of the Commission prescribing the form in which all freight and passenger tariffs by the railroads, street cars and steamboat companies shall be made and the manner in which they shall be filed with the Commission.

General Solicitor Clardy, of the Missouri Pacific Railroad, has notified the Public Service Commission that the railroad will not comply with the ruling of the Commission that through rates for continuous shipments over two or more lines must prevail over the higher local rates. Solicitor Clardy says such a rule is unjust, as extra work is required to transfer shipments from one line to another.

The Public Service Commission has ruled that it is unlawful for railroads to charge more than two cents a mile for transporting passengers who fail to buy tickets before they board a train, but in order to induce passengers to buy tickets, agreed to a penalty to ten cents to be collected from passengers paying on trains. This penalty is to be refunded on application at the general offices of the railroad. Heretofore, the railroads have been charging three cents a mile for persons paying their fares on the train.

Montana.—A sweeping investigation of all distributing rates charged by railroads operating in Montana from all distributing centers in the State has been ordered by the State Railroad Commission, and a hearing, at which commercial clubs from all over the State will be represented, was set for October 8th.

Nebraska.— The State Railroad Commission has notified the railroads operating in Nebraska to appear and show cause, in the first week in October, why its order No. 19, reducing freight rates from 20 to 60 per cent on all classifications except grain, lumber and coal, which was promulgated four years ago and suspended later to await the decision of the United States Supreme Court in the Minnesota rate case, should not go into effect.

New Jersey.— The Board of Public Utility Commissioners has refused to approve a proposed 99-year lease of the property and franchise of the Lehigh Valley Railroad Company, of New Jersey to the Lehigh Valley Railroad Company, of Pennsylvania.

Pennsylvania.— Steam railroad companies in Pennsylvania have been called upon by the State Public Service Commission to report how many steel and wooden cars are used in the transportation of passengers in the State.

The Public Service Commission has issued a statement regarding its position on the clause in the public service act, prohibiting issuance of passes to any but railroad employes in which it states:

"The Public Service Commission will not before January 1, 1914, pass upon the question as to the right of railroad companies to grant free passes to other than their employes."

Texas.—On account of delay in the work of reconstructing and standardizing the cut-off line of the Houston & Texas Central Railroad that runs between Mexia and Nelleva, the Railroad Commission has extended the time in which the work must be finished to January 1, 1914. The original order of the Railroad Commission required that the line be placed in good condition and a daily passenger train service each way established by September 1st.

ORGANIZATION.

September Meeting of Canadian Railway Club.—The September meeting of the Canadian Railway Club was held at the Windsor Hotel at Montreal on the evening of September 9th. A paper was presented by Mr. A. Crumpton, assistant engineer of the Grand Trunk Railway on "Railway Efficiency." A review of this paper will be published in a later issue of the "Railway World."

The Brotherhood of Trainmen Hold Meeting.—Between 1,000 and 1,200 members of the Brotherhood of Trainmen held a meeting in Red Men's Hall, Reading, Pa., August 31st. Representatives of the Brotherhood of Locomotive Trainmen, Locomotive Firemen and Engineers and Order of Railway Conductors were present. Mayor Ira W. Stratton welcomed the delegates at a short public session held at 1.30 P. M.

Following the opening exercises the railroaders went into executive session when matters of mutual benefit and the advancement of the or-

Digitized by Google

ders represented were discussed. While no definite information was given out, it was learned that the meeting was held for the purpose of taking steps to eventually merge all of the railroad organizations into one grand body which would make it one of the largest labor organizations in the world.

Fourth Annual Convention of American Manufacturers' Export Association.— Speaking before more than 300 delegates to the fourth annual convention of the American Manufacturers' Export Association at the Hotel Astor, September 25th, Charles M. Muchnic, manager of the Foreign Department of the American Locomotive Company, declared that a plan to force the Atlantic steamship combination to lower their ocean freight rates by a movement among the exporters to combine their tonnage for shipment in steamers chartered by themselves through some available steamship broker, who would receive only a nominal compensation for his services, had failed absolutely.

Mr. Muchnic declared that after he had investigated the "unprecedented rise in ocean freight rates since 1909, ranging from 50 to 150 per cent over those existing prior to 1908," he had reached the conclusion that the increase was due "not solely to the various steamship combinations, but mainly to the well known economic principle of supply and demand," due to the expansion of ocean commerce of the entire world which soon taxed every available steamer.

New Commissioner for Pittsburgh Commercial Club.—Ira S. Bassett, who has been appointed Commissioner of the Pittsburgh Commercial Club, was the originator of the "Made In Pittsburgh" Manufacturers' special train, which made its historic trip one year ago. It was one of the greatest of trade boosting tours, as it covered more than 5,000 miles and eighteen different States and thirty-six cities were profitably visited. The cars, engine and practically every detail of the entire equipment was made in Pittsburgh. Four special cars were devoted to exhibits, which, during the trip were inspected by many thousand people. One hundred business men accompanied by their wives made the tour. Mr. Bassett made this trip possible while he was connected with the Chamber of Commerce as traffic manager, which position he held for more than six years. Prior to that time he was with the Pennsylvania interests for eleven years. As Commissioner of the new organization he will have charge of the complete workings of the Club.

Meeting of Passenger Agents.—R. T. G. Matthews, Kansas City, Mo., was elected president of the American Association of Passenger Agents which held its forty-first annual convention at St. Paul, September 9th. The organization also voted to change the name to that of American Association of Traveling Passenger Agents. Other officers elected were: Vice-President, M. F. Bragg, Norfolk, Va.; secretary-treasurer, E. T. Monett, Chicago, re-elected. The 1914 meeting is conceded to San Francisco.

Society of Railway Financial Officers.— The Society of Railway Financial Officers concluded its three-day meeting, at Chicago, September 26th, with the election of the following officers: President, George A. Walker, Philadelphia, assistant treasurer of the Pennsylvania Railroad; vice-presidents, John E. Murphy, Chicago, treasurer of the Chicago & Western Indiana, and D. K. Kellogg, Richmond, Va., treasurer of the Richmond, Fredericksburg & Potomac.

Uniform Rate on Demurrage Planned.—Railroads affiliated with the American Railway Association have decided to authorize the supervision of freight car demurrage rules throughout the country by the organization's committee on relations between railroads, of which Arthur Hale is chairman.

This committee will appoint district supervisors whose duty it will be to see that demurrage rules are administered on a uniform scale throughout their respective territories.

Provision has been made that each railroad shall agree to furnish all necessary information and statistics and to pay a part of the expense incident to the supervision. This proportion will be fixed on the basis of the number of cars handled in each territory supervised.

Pittsburgh Chamber of Commerce Meeting.— At a special meeting of the Pittsburgh Chamber of Commerce, September 6th, that body went on record in favor of the repeal of the Sherman anti-trust law and the enactment in its place of a law to create a business commission, after the manner of the Interstate Commerce Commission to which disputes relating to the practices of business corporations can be referred.

A set of resolutions also was passed protesting against the placing of an import duty on bananas in the new tariff law. The resolutions stated that Pittsburgh consumed 2,830 carloads of bananas during the past year. The Chamber also adopted resolutions favoring the proposed constitutional amendment for the issue of $50,000,000 bonds by the State for the construction of roads.

Meeting of Second Congress of National Council for Industrial Safety.—The second Congress of the National Council for Industrial Safety closed a three-day session September 25th, with a banquet at the Hotel McAlpin, New York. The principal speeches were by Secretary W. B. Wilson, of the Department of Labor and Gov. J. K. Tener, of Pennsylvania.

At the final sessions of the convention, brief addresses on the progress of the movement for safety in industrial labors were delivered by R. C. Richards, Chicago & Northwestern Railroad; L. H. Burnett, Carnegie Steel Company; C. W. Price, Wisconsin Industrial Commission, and Dr. Lucian W. Chaney, Bureau of Labor.

Mr. Richards said that the vast majority of the American railroads have during the past three years, adopted the plan of safety, first, in the operation of their transportation systems. He said that his experience proved that the human element in labor of all kinds is the controlling factor in industrial accidents. The railroads have come to recognize that it is better to cause a delay than to cause an accident. It is the little accidents that make the big total of all accidents, and not the collisions which we see pictured as the cause of the great loss of life in the newspaper headlines. What we

Digitized by Google

want to do on American railroads and are doing as rapidly as possible, is to eliminate the chance-takers. Every time an accident occurs it is a notice that something is wrong and should be immediately followed by a careful investigation for the purpose of bringing out the real truth so that the wrong may be corrected.

Roadmasters' Convention. — At the closing session of the thirty-first annual convention of the Roadmasters' and Maintenance of Way Association at the Auditorium Hotel, Chicago, in September, the following officers were elected for the ensuing year: President, T. F. Donahue, Pittsburgh; first vice-president, C. M. Groover, Albert Lea, Minn.; second vice-president, B. C. Doherty, Beloit, Wis.; secretary, L. C. Ryan, Sterling, Ill. It was decided to hold the next convention in Chicago.

ELECTIONS AND APPOINTMENTS.

Executive.

J. D. Abeles, second vice-president, Atlantic Southern. Headquarters, St. Louis, Mo.

E. N. Armstrong, director, Toledo, Peoria & Western R. R.

W. W. Baldwin, director, Toledo, Peoria & Western R. R.

W. G. Bierd, director, Iowa Central Railway.

Chas. N. Black, vice-president, United Railways of San Francisco. Headquarters, San Francisco, Cal.

John Claney, president, Memphis and Pensacola.

C. H. Dawes, director, Toledo, Peoria and Western Railroad.

Howard Elliott, director, Maine Central Railroad.

Arthur T. Hadley, director, New York, New Haven & Hartford R. R.

F. H. Head, director, Toledo, Peoria & Western Railroad.

H. E. Huntington, director, Iowa Central Railway.

Samuel L. Kamps, assistant to vice-president, Chicago Great Western. Headquarters, Chicago, Ill.

John B. Kerr, president, New York, Ontario & Western Ry.

Jess W. Lillienthall, president, United Railways of San Francisco. Headquarters, San Francisco, Cal.

Fred C. MacMillan, vice-president, San Antonio, Uvalde & Gulf R. R. Headquarters, San Antonio, Texas.

R. J. McCarty, vice-president in charge of accounts, Kansas City Southern. Headquarters, Kansas City, Mo.

A. B. McDonald, vice-president, Southern Pacific R. R. of Mexico.

T. P. Shonts, director, Iowa Central Railway.

DeRoo Weber, vice-president, Atlantic Southern. Headquarters, St. Louis, Mo., and Atlantic, Iowa.

W. M. Whitenton, vice-president, St. Paul & Kansas City Short Line R. R. Headquarters, Des Moines, Iowa.

Joseph Wood, director, Toledo, Peoria and Western Railroad.

Legal.

Lee Monroe, general counsel, Scott City Northern.

Financial.

Robert Abeles, Jr., treasurer, Atlantic Southern. Headquarters, St. Louis, Mo.

W. F. Bull, assistant secretary, Southern Pacific and the Louisiana Western. Headquarters, New York.

A. M. Dahler, treasurer, United Railways of San Francisco. Headquarters, San Francisco, Cal.

J. H. Lauderdale, treasurer and purchasing agent, Louisiana and South Texas lines, St. Louis & San Francisco R. R. Headquarters, New Orleans, La.

W. E. Paschall, assistant treasurer, Atlanta, Birmingham & Atlantic, the Georgia Terminal Company and the Alabama Terminal Railroad. Headquarters, Atlanta, Ga.

John M. Reed, secretary, Atlantic Southern. Headquarters, St. Louis, Mo.

R. F. Watkins, treasurer, Denver and Rio Grande R. R. Headquarters, Denver, Colo.

G. B. Willcutt, secretary, United Railways of San Francisco. Headquarters, San Francisco, Cal.

Accounting.

C. A. Chapman, auditor, Nevada Copper Belt. Headquarters, Salt Lake City, Utah.

L. J. Hensley, auditor, Kansas City Southern. Headquarters, Kansas City, Mo.

F. C. Uhlman, assistant general auditor, Western Maryland. Headquarters, Baltimore, Md.

P. E. Wooley, assistant auditor, Kansas City Southern. Headquarters, Kansas City, Mo.

Engineering and Mechanical.

George W. Abbott, division engineer, Boston Division, Boston & Albany R. R. Headquarters, South Station, Boston, Mass.

A. B. Adams, master mechanic, Beaumont Division, Gulf, Colorado & Santa Fe. Headquarters, Silsbee, Texas.

E. W. Alling, master mechanic, Shore Line Division, New York, New Haven & Hartford. Headquarters, New Haven, Conn.

G. B. Bagley, assistant engineer, Missouri Pacific. Headquarters, Kansas City, Mo.

William Baumterger, road foreman of engines, Lake Erie & Western. Headquarters, Lima, Ohio.

L. Beauman, division engineer, Stockton Division, Southern Pacific. Headquarters, Stockton, Cal.

R. A. Becket, superintendent of signals, Grand Trunk. Headquarters, Montreal, Que.

R. A. Bellingham, master mechanic, Apalachicola Northern. Headquarters, Ft. St. Joe, Fla.

A. F. Blaess, district engineer, Yazoo & Mississippi Valley. Headquarters, Memphis, Tenn.

W. L. Blair, superintendent of telegraph, New York, Chicago and St. Louis. Headquarters, Cleveland, Ohio.

John C. Kuhns, purchasing agent, Illinois Central Railroad.

H. C. Macklin, assistant to general purchasing agent, Seaboard Air Line Railroad.

OBITUARY.

William Beal Clagett, for twenty-nine years an auditor and ticket agent at the Union depot in Kansas City, and widely known among railroad men of the West, died, aged 50 years. He was the originator of the stub method of selling railroad tickets, which has been adopted all over the country.

John S. Cook, master mechanic of the Georgia Railroad, at Augusta, Ga., died on August 28th, in Johns Hopkins Hospital, Baltimore, Md. Mr. Cook had been in railroad service sixty-four years. He was born on October 5, 1827, at Brooklyn, N. Y., and began railway work in April, 1849, as machinist in the shops of the Central Railroad at Savannah, Ga. Later he was machinist in the shops of the Georgia Railroad at Augusta. From 1850 to 1853 he was a locomotive engineer on that road; then from 1854 to 1878, about twenty-five years, he was foreman of shops. On the election of General E. P. Alexander to the presidency of the Georgia Railroad, in May, 1878, he was made master mechanic, and had held that position ever since.

John J. Coughlin, of Las Vegas, Nev., roadmaster of the Las Vegas & Tonopah, was run over by a passenger train and killed on August 7th. It appears that he had fallen from his motor car. He was lying on the track, and, as the train approached, was seen by the engineman and the fireman, but there was not space in which to bring the train to a stop. Mr. Coughlin was inspecting the track from Goldfield to Bonne Clare. It is supposed that he had fainted because of the heat. The motor car, uncontrolled, ran 21 miles down grade and collided with a hand car.

J. A. Courtright, formerly trainmaster of the Michigan Division of the Cleveland, Cincinnati, Chicago & St. Louis Ry., died at his home in Wabash, Ind., August 17th.

George W. Crary, treasurer of the New Orleans, Mobile & Chicago, at Mobile, Ala., died in that city recently. Mr. Crary was born in Cincinnati, Ohio. He was secretary and treasurer of the Mobile, Jackson & Kansas City, and when that company was reorganized under the name of the New Orleans, Mobile & Chicago, in 1909, he retained the same position, but since January, 1912, he has been treasurer only.

H. Daniels, chairman of the Board of Engineers of the United States Steel corporation, chief engineer of the American Steel and Wire Company, and president of the Washburn & Moen Co., died at his home after an illness of about a year.

J. J. Driscoll, trainmaster of the Baltimore & Ohio R. R., at Butler, Pa., died recently.

George M. Fraser, traffic manager and superintendent of the Nevada Copper Belt R. R., at Mason, Nev., died August 29th.

Edward A. Haskell, until recently division engineer of the Boston & Albany R. R., at Boston, Mass., died August 24th, aged 49 years.

John W. Holliday, superintendent of the New England railway mail service, died in Boston, August 24th, aged 62 years.

George M. Hughes, president and general manager of the New Jersey, Indiana & Illinois R. R., with office at New York, died at his home in Brooklyn, September 6th. Mr. Hughes was born at Southfields, N. Y., June 19, 1843. His first railway position was that of clerk in the auditor's office of the Erie R. R., with which company he remained serving in various capacities from November, 1863, to March, 1884. He was later connected with the Chicago, Milwaukee & St. Paul Ry., New York, Susquehanna & Western R. R., and Central of Georgia Ry. After holding office with various steamship lines, in October, 1903, he became secretary and general manager of the New Jersey, Indiana & Illinois and since October, 1905, has been president of the same road.

George L. Irwin, formerly division superintendent of the Chicago & Northwestern Ry., died at his home in Chicago, August 22nd, aged 82 years.

Joseph D. McCarrick, division freight agent of the Southern Ry., at Norfolk, Va., died in New York City, September 10th. Mr. McCarrick was about 40 years of age and had been with the Southern Ry. for 18 years.

C. M. Taylor, mechanical superintendent of the Second District of the Chicago, Rock Island & Pacific Ry., at Topeka, Kan., died on September 3rd, at Colorado Springs, Colo., aged 51 years. He had been granted leave of absence in July on account of illness. Mr. Taylor had been with the Rock Island since December, 1906, having previously been mechanical superintendent of the Western Grand Division of the Atchison, Topeka & Santa Fe Ry., with headquarters at La Junta, Colo.

VOL. LVII. NOVEMBER, 1913 No. 11

Important Developments in the Transportation Field

OUTLOOK FOR HIGHER RATES ENCOURAGING

The Eastern railroads finished in October, the filing with the Interstate Commerce Commission, of their freight tariffs containing a five per cent increase in the present rates on traffic transported between points north of the Ohio and Potomac rivers and east of the Mississippi River. As anticipated, the Commission suspended these rates until March 12th, of next year, in order to investigate the necessity for the increases named. Hearings will begin on November 24th, and continue as long thereafter as necessary to put the Commission in possession of all the facts of the case.

Certain developments recently appear to make almost inevitable the granting of the carriers' requests. High operating expenses, the added burdens involved in the recent decision of the Arbitration Board in the Eastern Trainmen's Wage Controversy, and a decided shrinkage in net earnings, not to mention a more recent similar tendency in gross, all combine to show that the railroads are facing a crisis in their development, unless relief is granted by which they can replenish their depleted coffers.

Many trade organizations and individual shippers throughout the country are coming out strongly in support of the rate increase, as it becomes more fully apparent that transportation facilities must soon fail to fully meet the requirements of commerce unless some measure of relief is granted by regulative authorities. For example, resolutions have been filed with the Commission by the Chicago Association of Commerce, one of the most important organizations of shippers in the United States, giving notice that the Association will not oppose the petition of the Eastern roads for a general advance of five per cent in their freight rates. In the East the executive committee of the New York Board of Trade and Transportation, in a report submitted at its regular November meeting, while declaring that the five per cent increase in freight rates should be tested on the principle of efficiency and management, also asserts that the railroads should be liberally dealt with, because upon their efficiency and ability to meet the demands of constantly growing business, depend the development and progress of the country. Other prominent organizations have taken an even more emphatic stand in favor of the increase.

Another encouraging development was the statement made by Chairman Clark, of the Interstate Commerce Commission, at the recent annual convention of the National Association of Railway Commissioners, to the effect that an ideal transportation situation could be attained only by large additions to the facilities and great improvement in methods and that the added facilities could be secured only through expenditures from surplus earnings or from expansion of credit. Chairman Clark affirmed that in either case the total cost to the purchaser of transportation would be increased. Railway executives find much encouragement in this statement, and taken in connection with other recent developments, believe that they can

CHAIRMAN E. E. CLARK,
of the Interstate Commerce Commission, whose recent address before the National Association of Railway Commissioners, while in no sense supporting a rate advance, is thought to be of an encouraging character by many railway officials.

Digitized by Google

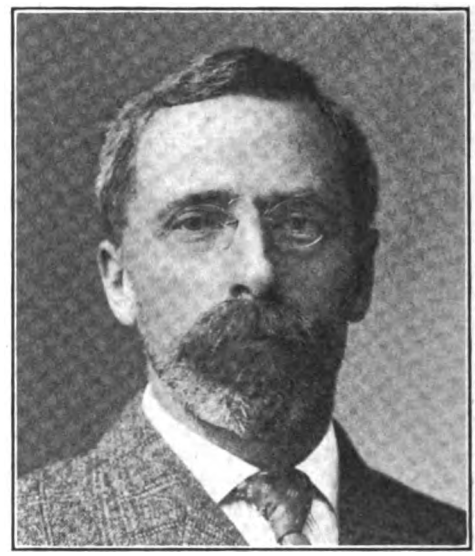
convince the Commission of the imperative necessity for the rate advances.

Not only are many commercial organizations and shippers supporting the railways' request for an increase in rates, but leading economists who have given this question careful consideration, are advocating the immediate necessity for granting some measure of relief. In a recent address Professor William Z. Ripley, of Harvard University, declared that instead of unexampled prosperity of a few years ago, the railroads are now facing a period of great financial depression. He asserted that the carriers now seem to be more or less at the mercy of circumstances and that organized labor under threat of general strikes, has forced substantial concessions both in wages and conditions. He pointed out that while the carriers have acquiesced manfully in the mandates of the people, that they shall be subject to public control, they now find themselves by the pressure of increasing cost of operation and of even greater demands from the public for more and better service practically compelled to throw themselves upon the mercy of the Interstate Commerce Commission for relief. To quote from the address:

This relief is demanded, not alone in the interest of investors, but in order that much-needed improvements and extensions commensurate with the developemnt of the country may be made. It is a self-evident proposition that unless the railroads are prosperous and protected in the exercise of their property rights, a healthy growth of transportation facilities cannot be had. Adequate service and the convenience of the public require that the present plight of the railways should receive the most earnest consideration. Under ordinary circumstances relief might be had from three directions: greater economy and efficiency; a substantial growth of traffic, or an increase of rates.

Economy and greater efficiency of operations, as a remedy for deficiency of revenue, played a part in the rate advance cases of 1910. But it is clear that railroads, as a field for the introduction of scientific management methods, are considerably handicapped. Rigid rules of the railroad brotherhoods are difficult to overcome. The wide geographical extension of operations renders detailed superintendence impossible. And the steadily increasing demands of the public for more and better service, regardless of cost, hinder the introduction of many plans for more scientific operation. On the whole, American railroads are operated at the high level of efficiency. Certain economies ought, nevertheless, to be effected. Among these should be a careful revision of purchasing department methods. Laxity and private profit ought to be rigorously excluded.

Increase in tonnage, as a remedy for the existing distress, promises less relief than might have been expected five years ago. This follows naturally from the rise of operating costs already mentioned. But it is also established by the clear demonstration that after certain point of traffic congestion has been reached, immediate, general and extraordinary outlay of capital is necessary in order to handle further increments of tonnage. Unless earnings, therefore, are sufficently ample to permit of large annual improvements out of income, the demand for new capital seems bound to outrun the earning power.



PROFESSOR W. Z. RIPLEY,

of Harvard University, who believes that relief in a large way for the present crisis in railway development can be afforded only by the sanction by the Government of a general increase of rates chargeable for service.

It is apparent from the foregoing statements that relief can be afforded for the present crisis in a large way only by the sanction by the government of a general increase of rates chargeable for service. Experience of the last ten years emphasizes the point that such relief can scarcely be afforded piecemeal. The growing unity of interest of all carriers arises not only out of the close interrelation of rates all over the country under the stress of commercial competition but also because of the practical standardization of the largest item in railway expenses, namely, the outgo for wages under pressure from the railroad brotherhoods. It would appear, therefore, that in place of attempts, road by road, to raise rates on individual commodities, what is needed is the formulation of a carefully prepared plan of more general revision. A substantial increase of revenue by means of higher freight rates seems, then, inevitable.

The railways deserve protection, finally, against further continuance of special in-expert legislation by the several states. With powerful railroad commissions, now established by law in most of the commonwealths, the legislatures ought to refer all such matters of regulation and service to such boards. The enactment of drastic and inflexible full-crew and hours of service laws may work great hardship in the future. All such matters should be referred to administrative boards, which may apply the law with due regard to public needs and the circumstances of the case.

THE AWARD IN THE EASTERN TRAINMEN'S WAGE CONTROVERSY

Labor has again won a decisive victory over the railways. The Board of Arbitration appointed to settle this controversy has seen fit to authorize an increase of approximately 7 per cent in the wages of 80,000 trainmen and 20,000 conductors. This means an additional annual expenditure for railways in the Eastern territory of $6,000,000. While the increase demanded by the men was approximately 20 per cent, what was actually granted probably came up to their full expectations under the circumstances.

The award was concurred in by the neutral members of the Board who were Seth Low, president of the National Civic Federation, and John H. Finley, president of College of the City of New York; and also by the labor representatives who were L. E. Sheppard, representing the Order of Railway Conductors, and D. L. Cease, representing the Brotherhood of Railway Trainmen. Dissenting opinions were rendered by W. W. Atterbury, vice-president of the Pennsylvania Railroad, and A. H. Smith, vice-president of the New York Central Lines, who represented the railroads on the Board. Messrs. Sheppard and Cease also filed a minority report because of the failure of the Board to standardize the Eastern wages in accordance with those of the West. The increase granted is to date from October 1, 1913, and to remain in effect one year. Among its general recommendations the Board urges an independent wage inquiry to embrace the rates of pay on all American railroads with the view of establishing a scientific basis for the payment of all classes of railroad employes.

In reaching its award the Board ruled mainly against the employes on four out of five points submitted as reasons why the increase should be granted and found for them on the fifth, the increased cost of living. Since 1909, when last an increase was granted, the arbitrators found the cost of living had increased 7 per cent. Certain minor contentions embraced also were conceded to the employes. It was, therefore, more than a coincidence that the increase granted in wages is exactly the increase in the cost of living, as outlined by documents introduced by the employes.

"The Board does not found its action entirely upon the increased cost of living," reads the award, a document of 75 printed pages, "though it looks upon this as a basic." Without attempting to standardize the rates of pay between railroad employes of the East and the West, the Board asserts its belief that it is desirable, but not possible at the present time. As to this, the award voices the opinion that Congress should make an inquiry as to whether there is any longer a substantial reason for the maintenance of a wage differential between the two sections.

The articles are dealt with separately and fix the pay for various classifications of labor. While technical in verbiage, they provide chiefly that the monthly pay of employes in the passenger branch of the service shall be:

Conductors, $135; baggagemen, $82.50; flagmen and rear brakemen, $78; brakemen, $76.50. Overtime, per hour, conductors, 45 cents; assistant conductors and ticket collectors, 35.7 cents; baggagemen, 27.5 cents; flagmen and rear brakemen, 26 cents; brakemen, 25.5 cents.

For the freight service, the chief awards are:

Through runs, conductors, 4 cents a mile; flagmen, 2.67 a mile; brakemen, 2.67 a mile; any run less than 100 miles to be paid for as if it were 100 miles. In way freight, pick up or drop, mine and roustabout service, same minimum, conductors are awarded $4.50 a day of 100 miles or less, 10 hours or less; flagmen, $3.10, and brakemen, $3; overtime to be paid for as time and one half.

This was one of few instances in which the employes triumphed in their demand that overtime be paid for at one and one half the regular rate. The award is distinctly against such practice in most instances. To this finding the employes' representatives filed a minority report of protest. To the entire finding the railroads' representatives dissented.

> We dissent from this award because standardization is chimerical and uneconomic; because such increased cost of living as has occurred is not sufficient to justify the increase granted; because statistics prove that risk has decreased and hours of labor have decreased and the weight of evidence is that labor has not increased.

Of vital importance to the employes is the finding that present schedules of pay are not to be changed or disturbed in any way where they exceed the amounts named, nor are employes to be curtailed either in mileage or hours of labor to offset the increase granted.

The railroads' contention that they are be-

Digitized by Google

tween two horns of a dilemma from which there is no apparent escape—that they must either raise rates or cease raising wages—is dismissed by the arbitrators with this assertion:

> This Board believes it must make its findings without any reference to the dilemma in which the railroads are evidently placed. The Interstate Commerce Commission and not this arbitration board has the duty of determining whether the railroads can earn in addition to their other charges, without an increase in rates, the rates of pay that this Board believes at the present time to be due to the conductors and trainmen.

However, the Board calls the attention of the Interstate Commerce Commission to the decrease of hazard that follows the installation of steel cars, double tracking and improved signals. On this point the award says:

> All of these things cost in the aggregate an immense sum of money. Any policy that would make it impossible for the railroads to command this money would be a profound misfortune to the whole nation. Such a policy would be bad enough in its effect upon transportation, because it would reduce the efficiency of the railroads; but it would be criminal in the sense that it would make the great army of railroad employes, who are numbered by hundreds of thousands, follow their hazardous occupation under conditions more hazardous than are necessary, and, indeed, more hazardous than are justifiable in a country like this.
>
> The increasing safety of passengers is equally involved. No American reads the records of railroad accidents in the United States without feeling a sense of reproach. This Board wishes to call the attention of the country to its belief that railroad accidents can be reduced almost precisely in proportion to the modernizing of the railroads and the improvement in their equipment.

It is difficult to understand how the Board of Arbitration justified its award on practically the sole basis of an increase in living expenses on the part of the men. While no one denies the fundamental justice of such an award, could it be applied to the whole people of the Nation, its application to a certain class works a grave injustice to the less fortunate other classes.

Why should provision be made to keep the wages of railway labor on a parity with the increased cost of living, because with their strength as a labor organization, they threaten to tie up the commerce of the country, when other classes receive no such protection, and why should these other classes be compelled to keep railway wages on such a parity by digging down in their pockets for the additional money? This, in the last analysis, is what must happen. Either those who have capital invested in railway property must pay for the advances thus doled out, or else those who employ the railways for transportation purposes must foot the bill. In either or both cases, one class is being arbitrarily protected at the expense of other classes.

As the matter apparently stands to-day, railway labor, which forms only a comparatively small part of the public, is given every possible consideration in the matter of increased wages, shorter hours and general conditions, while on the other hand, the stockholders who really form a large intrical part of the masses are receiving scant consideration on the part of the various legislative and regulative bodies. Perhaps there is one gleam of hope for railway managers in the prevailing opinion of the Board that the present wage movement by the trainmen and conductors in Eastern territory, "is the close of an old cycle of wage advance movements and not the beginning of a new one." This would at least indicate that future efforts along these lines are not likely to prove as successful as in the past.

Another remarkable point in the decision, is the manner in which the Board disposes of the railroads' contention that their earnings under present conditions do not justify them in granting any wage increases at the present time, and that there is no possibility that such earnings would justify it without a substantial increase in freight rates.

In considering this point, as heretofore noted, the Board holds that it must make its findings without any reference to the dilemma in which the railroads are evidently placed and that the Interstate Commerce Commission and not the Arbitration Board, has the duty of determining whether the railroads can earn in addition to their other charges, without an increase in rates, the rates of pay that the Board believes at the present time to be due to the conductors and trainmen. In other words, the Board decides to increase the wages of the trainmen irrespective of the ability of the roads to meet such increase. If the principle herein laid down should be applied to business generally, it would not be hard to foretell the disastrous results which would follow.

Of course in the case of the railroads, the Board considers the Interstate Commerce Commission as a safety valve, but whether an adequate rate advance will be permitted or at what time it will be granted, are ques-

Digitized by Google

tions of the future, and in the meantime, the carriers must shift for themselves in the best way possible. Should some of them be forced to the wall, the Arbitration Board, according to its findings, should receive no censure, because other regulative authorities have failed to properly sense the situation. Truly the paths of the railroads are not strewn with roses.

It is estimated by Vice-President Atterbury and Vice-President Smith, who filed the dissenting opinion, that the award will consume the interest on $120,000,000 which is needed for increasing efficiency, safety and equipment, and that serious consequences are apt to result from the decision. It is also asserted that the award further widens the disparity between the trainmen's wages and those in other lines, by adding to wages already unduly high, and thus making equitable treatment of all employes difficult if not impossible. The dissenting brief reads as follows:

Whatever merit the award may find with the contending parties or the public, there can be no doubt it is the result of the conscientious, fair-minded and exhaustive effort on the part of the members of this Board. It is with great regret that we feel constrained to separately express our views, because of the serious consequences which we feel are apt to result from its decision.

The men asked for the Western rates of pay: (1) In the name of standardization. (2) On account of the increased cost of living. (3) On account of the increased productivity of a train crew. (4) On account of the increased risk, labor and responsibility. (5) On the ground that the profits made by the railroads in recent years have increased out of proportion to wages.

The Board has awarded approximately a seven per cent increase, amounting to nearly $6,000,000.

(1) It states "that it cannot be controlled in its findings by the argument for standardization, although it may be influenced by it."

(2) It finds that "there has been a substantial increase in the cost of living since adjustment of 1910," but says "the Board does not found its action entirely on the increased cost of living, though it looks upon this as basic."

(3)-a It states that "all the statistics available indicate that the risk to trainmen in later years is decreasing rather than increasing."

b It states that "it is not convinced that the labor in handling the trains of to-day is any greater now than in 1910 when the last adjustment was made."

c It "believes that there has been a certain increase in responsibility," but "it is impossible to state quantitatively how great this increase of responsibility is as compared with the responsibility conductors and trainmen had to bear in 1910, at the time of the last settlement."

(4) It finds "that the extra productivity of the train crew comes from the increased number of engines" and "not from any contribution of extra productivity by the train crew itself."

(5) It "finds itself unable to relate the facts in this class of exhibits (i. e., the exhibits of the employes as to profits and wages) to the question of wages in such a way as to found thereupon specific increases in rates of pay."

Without correlating the above with "other elements" mentioned, all of which the Board states are "impossible to quantitatively measure" it believes that taken together they justify an increase in wages in the total of seven per cent.

We dissent from this award:

First. Because "standardization" is chimerical and uneconomic.

Second. Such increased cost of living as has occurred is not sufficient to justify the increase granted.

Third. Statistics prove that "risks" have decreased; prove that "hours of labor" have decreased; the weight of evidence is that "labor" has not increased; and we cannot agree that it has been proven that anything so intangible as "responsibility" has been increased.

Fourth. The conductors and trainmen are but one of the many factors in efficient railroad operation, and are no more responsible for increased productivity than any other class of railway labor.

The seven per cent additional wages granted by this award, which will cost the railroads $6,000,000 a year, is in addition to the $4,000,000 recently added to railway expenses through extra crew laws passed in this "territory at the behest of these labor organizations. Thus a total of $10,000,000 annually is added to the pay of trainmen without additional service being received by the railroads or the public.

The annual burden of $6,000,000, which the award imposes, as well as the additional $4,000,000 must necessarily precede all fixed charges. The sum of $6,000,000 represents the annual interest at five per cent upon $120,000,000 capital and this annual burden is thrust upon the railroad companies at a time when the public should have increased and improved facilities and when the difficulties of raising new capital are daily increasing.

We believe that every class of employes should be properly and equitably treated. This award further dividing the disparity between trainmen's wages and those in other lines, adding to wages already unduly high, makes equitable treatment of all employes difficult if not impossible.

We hope that the Board's conclusion that their action may result in a greater contentment and a greater stability of rates of wages within the Eastern and Southeastern territories will be realized, but we feel the result of this arbitration cannot but further encourage that continual round of wage demands upon the railroads which regularly involve strike votes, public anxiety, mediation, arbitration and compromise. It has been an endless chain process, one section of the country being exploited by means of another; railway employes previously satisfied have been stirred into restlessness by other classes of labor receiving unjustified wage increases.

We are in accord with the Board's opinion that some competent governmental body should make a study of the proper economic basis for the fixing of wages.

It is most unfortunate that the railroads should be compelled to divert further sums from the essential investments—improved signals, elimination of grade crossings, heavier track and bridge structures, steel cars and other improvements absolutely necessary to the highest state of safe opera-

Digitized by Google

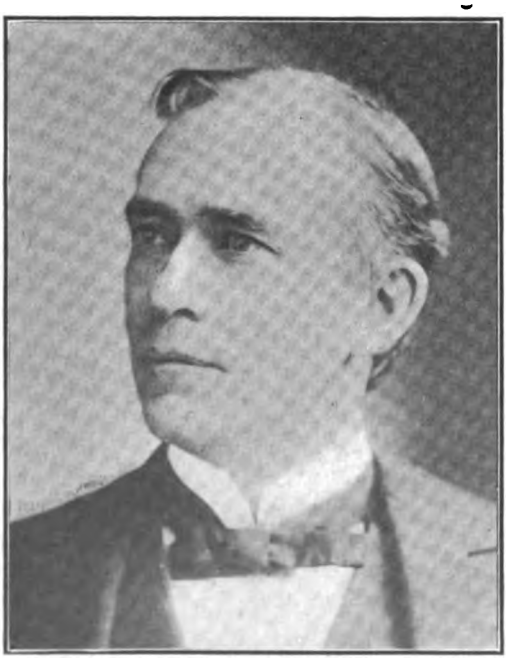
tion and to greater safety of the public and the employes themselves.

We had hoped that this arbitration would bring the wage problem more nearly to a solution, but we cannot subscribe to the reasons advanced for the conclusions reached, and, therefore, we feel constrained to dissent therefrom.

THE SITUATION IN THE WEST

Now that the Eastern trainmen's wage controversy has been settled, attention is centered on conditions in the West. Forty thousand locomotive engineers and firemen employed by the railroads operating between Chicago and the Pacific Coast have notified officials of these lines of their desire to terminate the present labor agreement and they demand a wage increase which, in the aggregate, would amount to many millions of dollars.

The railroads in turn have notified Warren S. Stone, grand chief engineer of the Brotherhood of Locomotive Engineers, and W. S. Carter, grand chief of the Brotherhood of Locomotive Firemen and Enginemen, that they are also dissatisfied with existing contracts and will welcome a readjustment of wage schedules and working conditions. Railway managers feel that when negotiations are begun they will be in a position to show that a substantial number of decreases should be put into effect, rather than the increases for which the men are contending.



HONORABLE CHARLES A. PROUTY,

who has resigned from the Interstate Commerce Commission to personally direct the work of procuring the physical valuation of American railways.

One of the most important demands of the engineers and firemen is for a joint contract with the roads. Each has had a separate agreement with the railways for many years and the joint contract plan is regarded as a distinct step along the lines of the federation scheme which has been agitated for a number of years among railway employes. The entire matter is likely to be submitted to a Board of Arbitration.

There has been no indication given by the Order of Railway Conductors and the Brotherhood of Railway Trainmen of the Western roads, that they have any immediate intention of attempting to force an increase in wages. At their recent meeting, held in Chicago, the matter of increased pay was not taken up, and only questions of an entirely different character were discussed. In fact there appears no intention of these organizations to agitate this question in the near future.

The arbitration of the controversy between the Chicago, Burlington and Quincy and its trainmen, is proceeding in an orderly manner. Henry S. Boutell, former Congressman from Illinois, has been elected chairman of the Board, and H. S. Milsted, of Washington, has been chosen secretary. The men have submitted thirty-nine questions for arbitration.

PHYSICAL VALUATION

The big development in physical valuation activities during the month has been the announcement of the retirement of Charles A. Prouty as a member of the Interstate Commerce Commission in order that he may give his exclusive attention to the direction of this work. While the whole physical valuation plan has made a tremendous gain by this appointment, the Interstate Commerce Commission has lost one of its ablest members and the railroads can only hope that as strong and just a man will be appointed in his place.

Mr. Prouty, in his seventeen years of service with the Interstate Commerce Commission, has become known as one of its ablest and hardest working officials. Mr. Prouty is a Republican. That a Democratic Chief Executive should vigorously urge him to remain on the Commission in spite of his desire to resign, constitutes a remarkable tribute to his integrity and ability and a

Digitized by Google

willingness on the part of President Wilson to rise above party lines for the welfare of the country.

In discussing physical valuation in a recent article appearing in the *Columbia Law Review,* Royal E. T. Riggs, of the New York Bar, asserts that no more gigantic task has ever been imposed upon an administrative body than that imposed upon the Interstate Commerce Commission. He said in part:

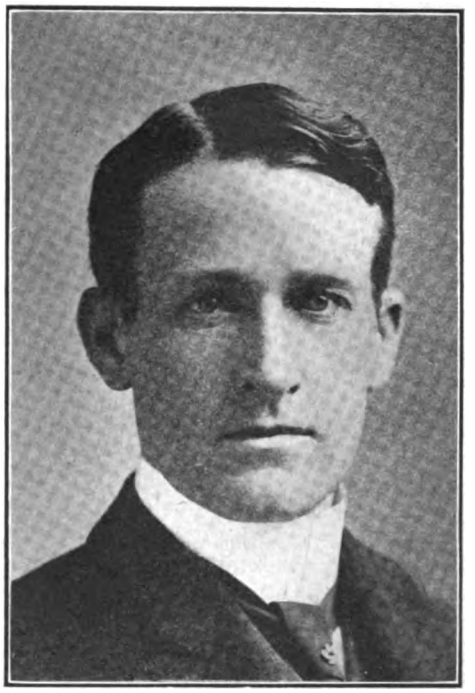
Valuation cannot be completed too soon for the investing public, nor Congress act too speedily to confer all jurisdiction over the railroads upon the Commission. Millions of ordinary business men in this country would be appalled to be subjected to the control of not one but many governmental agencies—such as the Northern Pacific Railroad, subject to rate regulation by the Minnesota, North Dakota, Wisconsin, Montana, Washington and Oregon railroad commissions as well as the Interstate Commerce Commission. Such a state of affairs is intolerable. Railroads, as well as men, cannot serve so many masters.

The investing public, and, perhaps the railroads themselves, do not yet realize the importance of the Minnesota Rate Case decision and the extent to which it places the railroads at the mercy of the various state ratemaking bodies. Whatever may be the result of the valuation of the roads as a whole, successful attack upon a schedule of intrastate rates promulgated upon all interstate roads has been made almost impossible. The great difficulty in all confiscation cases involving intrastate state rates has been in apportioning the value of the road used for interstate commerce and intrastate commerce, for whether the business is both interstate and intrastate, the question whether rates fixed for intrastate commerce afford a fair return must be determined by considering separately the value of the property employed in intrastate business and the compensation permitted in that business under the rates prescribed.

In order to systematically conduct its physical valuation work, the Commission has divided the country into five districts each of which embraces approximately 50,000 miles of railroad. The title of each district, the headquarters city and the state included in each are as follows:

Eastern, Washington, D. C., Connecticut, Delaware, District of Columbia, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, North Carolina, Pennsylvania, Rhode Island, Vermont, Virginia and West Virginia.

Southern, Chattanooga, Tenn., Alabama, Florida, Georgia, Indiana, Kentucky, Mississippi, Ohio, Panama Porto Rico, South Carolina and Tennessee.



FORMER GOVERNOR HERBERT S. HADLEY, OF MISSOURI.

who has been retained by the Western roads to represent them in physical valuation matters.

Pacific, San Francisco, Alaska, Arizona, California, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington and Wyoming.

Central, Chicago, Arkansas, Illinois, Iowa, Louisiana, Michigan, Minnesota and Wisconsin.

Western, Kansas City, Colorado, Indian Territory, Kansas, Missouri, Nebraska, North Dakota, Oklahoma, South Dakota and Texas.

Former Governor Herbert S. Hadley has been retained by the railroads west of the Mississippi to represent them in physical valuation matters. A public statement affirming the appointment of Mr. Hadley has been made by Vice-President Holden, of the Chicago, Burlington and Quincy Railroad, who is chairman of the Western committee on federation valuation, and is as follows:

A number of the important Western lines have approved the employment of Pierce Butler, of St. Paul, and ex-Governor Herbert S. Hadley, of Kansas City, effective November 1, as joint counsel for the Western lines in the federal valuation of railroads now being made by the Interstate Commerce Commission. The completion of this work will require several years, and the great importance of it to all concerned has required the employment of special counsel to represent the roads.

RAILWAY PRESIDENTS CONFER WITH POSTMASTER-GENERAL

In our issue of October, attention was called to a letter sent by Ralph Peters, chairman of the Committee on Railway Mail Pay to Postmaster-General Burleson, in response to his public statement that he was perfectly willing to consider any evidence the railroads had to show that they were not receiving adequate compensation for carrying the mails. Mr. Peters' letter, as have other documents published by the Committee on Railway Mail Pay, showed very conclusively that the railways are not only receiving inadequate compensation for carrying the mails, but that for a considerable part of such carriage they are receiving no compensation whatever.

Later in October the Postmaster-General had a conference with a delegation of American railway presidents for the purpose of more thoroughly going into this matter. Those who attended the conference were, President Ripley, of the Santa Fe; President Peters, of the Long Island; President Finley, of the Southern; President Delano, of the Wabash; President Brown, of the New York Central; President Rea, of the Pennsylvania; President Stevens, of the Chesapeake and Ohio; Vice-President Baldwin, of the Burlington, and Vice-President Andrews, of the Southern.

President Ripley, of the Santa Fe, acted as spokesman for his associates, being seconded by President Rea, of the Pennsylvania. They declared that the railways now were being underpaid an aggregate of $15,000,000 a year for carrying the mails, entirely aside from the extraordinary burden placed upon the roads by the parcel post matter, for which, it was maintained, they practically were receiving nothing.

President Ripley conceded that the roads were obligated to carry the mails, but expressed the hope and expectation that the Postmaster-General would give them such pay as would enable them to perform their service satisfactorily.

Mr. Burleson assured the railway men that he would try to see to it that they received all they were entitled to. He said, however, that it would be impossible for him to do anything in the way of readjusting railway mail pay until the commission created by Congress for the purpose of collecting and tabulating data bearing upon the subject had made its report, probably on March 4 next. He indicated that he considered that the railroads were under distinct obligations to the Government in many ways and that those obligations ought to be and very likely would be taken into consideration in the fixing of the compensation for mail transportation.

The Postmaster-General told his callers, incidentally, that it was his intention further to extend the facilities of the parcel post system, both by increasing the present maximum weight limit and by reducing the rates.

Some of the members of the committee later expressed themselves as being satisfied with the reception they had received. They attached due importance to the Postmaster-General's assurance that he proposes to see justice done the railroads and they feel confident that he cannot fail to perceive the strength of their case when he has had time to study the data submitted on the subject. It is conceded, however, that there is little prospect of obtaining an increase of mail pay until some time after Congress has received the report of the Bourne Commission which has until March 4th to make such report.

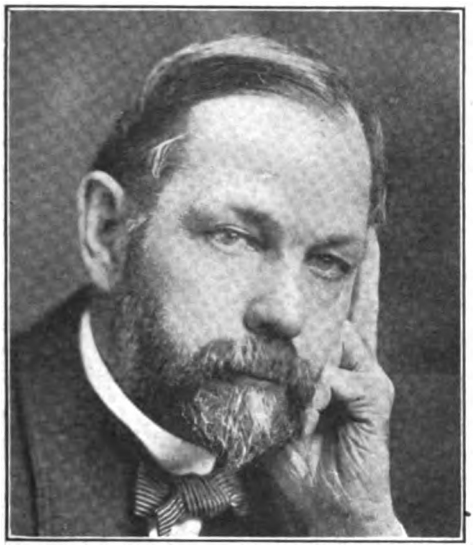
There is a possibility that the railroads may obtain an annual weighing on all lines instead of the quadrennial weighing now practiced. This change lies within the present authority of the Postmaster-General. Mr. Burleson is inclined to regard annual weighing as too expensive, but the railroads have informally and tentatively offered to bear this burden themselves, and it is possible that an arrangement satisfactory to the Postmaster-General and of some benefit to the railroads may be arranged.

CONVENTION OF NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS

The convention of the National Association of Railway Commissioners which was held in Washington from October 28th to 31st, was notable chiefly for one important piece of legislation recommended, namely, that Congress should empower the Interstate Commerce Commission to regulate the capitalization of all interstate carriers. The importance of this recommendation was apparent in view of the unanimous agreement of the members of the various state commissions, practically all of whom agreed that it would be better to turn this work over to the Federal Commission than to have capital regulated piecemeal by the various states.

At the opening session on October 28th,

Digitized by Google



O. P. GOTHLIN,
the retiring president of the National Association of Railway Commissioners.

President O. P. Gothlin, formerly of the Ohio Commission, presided. Edgar E. Clark, chairman of the Interstate Commerce Commission, made an address of welcome to the delegates, referred to at greater length elsewhere, which was thought by many to indicate a view favorable to an advance in rates.

President Gothlin, in his opening address, asserted that the members depended too much upon the committees who presented excellent reports but which were not followed by any definite action and that furthermore these reports were frequently the work of the chairman alone. He urged state commissioners to take more interest in the complaints of all shippers, even those concerning interstate commerce, and suggested that formal complaints should be abolished and that the Commission hear ex-parte complaints, assuming the burden of prosecuting the cases.

Commissioner McChord, of the Interstate Commerce Commission, in presenting the report of Committee on Amendment of the Act to Regulate Commerce, recommended

COMMISSIONER L. B. FINN, OF KENTUCKY,
who has been elected president of the National Association of Railway Commissioners.

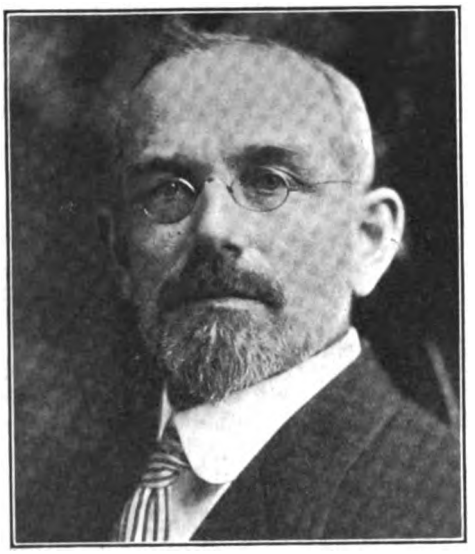
WILLIAM F. CONNELLY,
re-elected secretary of the National Association of Railway Commissioners.

that complaints asking for reparation may be filed with the Commission in three years from the time the cause of the action accrues instead of two. He also recommended an amendment to provide that failure to post contemplated rates at the time proposed tariffs are filed with the Commission shall prevent the new rates becoming effective.

Chairman Clark, of the Interstate Commerce Commission, suggested that carriers be penalized for failure to post tariffs at every station.

The report of the Committee on Delays Attendant upon the Enforcement of Orders of Railway Commissioners was presented by C. B. Aitchison, of Oregon, who

Digitized by Google

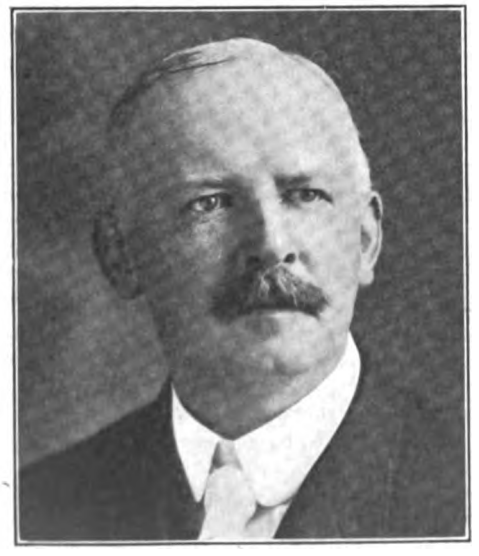


B. H. MEYER,

of the Interstate Commerce Commission, who urges that the railways devote greater attention to the assignment of expenses as between freight and passenger service.

recommended that the committee be abolished and its work be transferred to the Committee on Legislation. This suggestion was adopted.

The report of the Committee on Express Service and Rates presented by Martin S. Decker, of the New York Public Service Commission, emphasized the importance of the work done by the Interstate Commerce Commission in the regulation of express

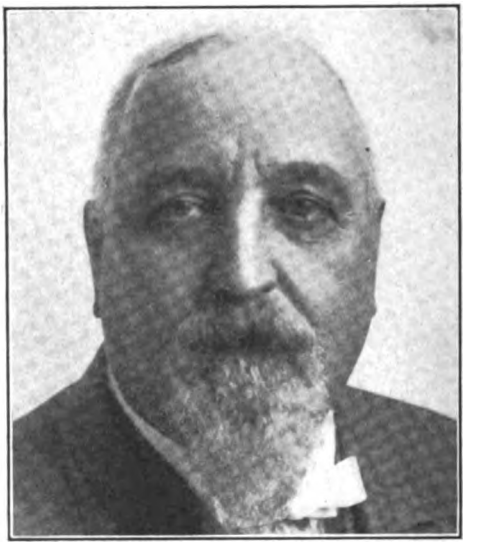


COMMISSIONER MARTIN S. DECKER, OF NEW YORK.

who presented a report on express service and rates.

matters and suggested the need for a committee to consist of one representative from each of the state commissions, representatives of the Interstate Commerce Commission and of the express companies to try to arrive at some working basis for the uniform adjustment of intrastate rates. It was voted to appoint a committee representing the various commissions to formulate a uniform method of stating intrastate rates.

The report of the Committee on Grade Crossings and Trespassing was presented by Charles Elmquist, of the Minnesota



WILLIAM KILPATRICK,

secretary of the Illinois Railroad and Warehouse Commission, who declared it was of greater importance to take steps to avert collisions and derailments than to provide steel cars to mitigate their results.

Commission. It was pertinently suggested that at the present time there was more need for action than for the presentation of views.

The Committee on Safety Appliances was represented by William Kilpatrick, secretary of the Illinois Railroad and Warehouse Commission, who presented an individual discussion in which it was pointed out that it is of far greater importance to take steps to avert collisions and derailments than to provide steel cars to mitigate their results. He also referred to the need for the enforcement of laws to prevent trespassing. He asserted that the improvement most needed at the present time is the control of trains by an absolute space limit carefully defined by block signals and rigidly enforced, and, if necessary, further protected by automatic train stops.

Digitized by Google

CHARLES ELMQUIST,
of the Minnesota Railway Commission who presented a report on grade crossings and trespassing.

The report of the Comimtte on Legislation was presented by Lawton T. Hemans, of the Michigan Commission. He asserted that the legislative need of the present is the elimination of the needless and senseless conflict that exists between the state and federal authorities upon phases of interstate and intrastate commerce. He recommended that proper action be taken to permit the Committee on Legislation to confer with the Commissioners on Uniform State Laws at their next annual meeting so that there may be brought about a basis of co-operation in the preparation and support of legislation affecting commerce and transportation within the various states.

An address delivered by L. B. Finn, of the Kentucky Commission, vigorously opposed the idea that the Federal Government had power to regulate intrastate rates as soon as Congress sees fit to exercise the power.

The report of the Committe on Railway Capitalization was presented by John M. Eshelman, of California. It included a review of the various state laws dealing with capitalization, and a large number of letters from state commissioners as to the practical working of the laws. The following is a summary of its recommendations which, as stated in the opening paragraph, received the unanimous endorsement of the Association with the exception of the fourth which provides for "no limitation as to the amount for which stock or bond shall be sold":

We do not believe it necessary for the purposes of this paper to recommend any particular form of an act, but we do believe that we should recommend the minimum which should be provided, and this minimum we believe should be the following:

1. The limitation in the act of the purposes for which the issue of stocks and bonds shall be permitted.

2. Authority to the Commission to see to it that the proceeds of the sales of stocks and bonds are devoted to the purposes for which they are issued.

3. No stocks or bonds to be issued without the positive approval of the Commission, or at least a veto power should be reposed in the Commission similar to the power which the Interstate Commerce Commission has to suspend rates. If this method is pursued, the same full investigation should be required on the part of the Commission in every instance, as is required when the affirmative action of the Commission is provided for.

4. No limitation in the statute as to the amount for which either stocks or bonds shall be sold.

5. The power shall be reposed in the Commission to impose conditions and to grant the application of the utility, either in accordance with such application or in lesser or greater amount, and to impose such other conditions as the Commission shall deem necessary.

6. Regulation of the stocks and bonds of interstate common carriers to be delegated to the Interstate Commerce Commission.

Basing our recommendation upon the foregoing conclusion, your committee respectfully recommends:

That Congress immediately pass an act empowering the Interstate Commerce Commission to regulate the stocks and bonds of interstate carriers in the manner and to the extent hereinbefore outlined.

In conclusion, your committee desires to impress upon the members of this Association the tremendous importance of the matter we have been here considering. The regulation of the securities of utilities, other than interstate carrers, is being handled with increasing efficiency by the various states from year to year, and the beneficial results flowing therefrom are being recognized, not only by the public as patrons of these utilities, but by the utilities themselves. In those states where most adequate regulation is now being provided, money is being invested in increasing amounts and the stability of securities is being established and healthy financial conditions are being brought about. In substantiation of this conclusion, we respectfully invite your attention to those states wherein the commissions have been given adequate and plenary authority to deal with this subject, and suggest that the members of this Association consult with the representatives of the utilities from such states in the belief that such representatives will bear out the statement herein contained that from the viewpoint of the honest public utility, honest, adequate and intelligent regulation is a good thing.

In the case of the interstate carriers, however, by reason of the facts hereinbefore referred to, it is possible for the various states to regulate, and the federal government should not lag behind in this field wherein it alone is competent to act.

Milo R. Mabie, of New York, presented the report of the Committee on Railroad Taxes and Plans for Ascertaining the Fair

Digitized by Google

Valuation of Railroad Property. This consisted of a series of special papers as follows:

A Just and Scientific Basis for the Establishment of Public Utility Rates, with Particular Attention to Land Values, by Commissioner Max Thelen, of California. Discussed by Commissioner Clifford Thorne, of Iowa.

Elements of Appreciation in Railroad Valuations, by Commissioner George A. Henshaw, of Oklahoma.

Accounting Side of Rate Making, by Dr. E. W. Bemis, of Chicago. Discussed by Commissioner R. Hudson Burr, of Florida.

Depreciation and Its Relation to Fair Value, by Dr. A. F. Weber, Chief Statistician of New York Public Service Commission, First District.

Valuation of Property Constructed from Surplus Earnings, by Commissioner Forest E. Barker, of Massachusetts. Discussed by Commissioner W. M. Daniels, of New Jersey.

On motion of Commissioner Thorne, of Iowa, a resolution was adopted providing for the appointment by the president of the Association of a committee of fifteen to cooperate with the Interstate Commerce Commission in making the valuation of railway property.

Mr. Klapp of the Wisconsin Demurrage Bureau, presented a paper on Demurrage as a Measure of Relief from Car Shortage, in which he showed that car capacity has increased 69.22 per cent, locomotive tractive power 109.5 per cent, and ton-miles only 28 per cent. He suggested that relief can be found in higher demurrage rates which will make it more economical for the business man to store his own goods than to pay the carrier for doing it for him.

B. H. Meyer, of the Interstate Commerce Commission, presented the report of the Committee on Statistics and Accounts, urging that greater attention be devoted by the railways to the assignment of expenses as between freight and passenger service. In discussing the paper Commissioner Clark said there is urgent necessity for the adoption of a uniform method of reporting loss and damage claims.

Clifford Thorne, of the Iowa Commission, presented the report of the Committee on Uniform Classification and Simplification of Tariff Sheets, which after reviewing the history of the agitation for uniform classification, concluded with a recommendation "that there should be appropriate legislation by Congress, authorizing and directing the Interstate Commerce Commission, assisted by a body of disinterested experts appointed by the Commission, and paid by the federal government, to frame and promulgate a classification of freight to apply uniformly over the United States."

James E. Sague, of the New York (Second District) Commission, presented the report of the Committee on Rails and Equipment, which included a general discussion of rails, speed recorders and steel cars, supplementary to the committee's report of last year.

At the suggestion of Commissioner Marble the constitution was amended to make the Canadian Board of Railway Commissioners eligible to membership in the Association.

The following officers were elected for the ensuing year: President, Lawrence B. Finn, of Kentucky; first vice-president, Clifford Thorne, of Iowa; second vice-president, Robert R. Prentis, of Virginia, secretary, William H. Connolly, Washington, D. C.; assistant secretary, William Kilpatrick, of Illinois.

The next convention will be held at Washington on November 17, 1914.

ANNUAL MEETING OF RAILWAY BUSINESS ASSOCIATION

The Railway Business Association holds its fifth annual meeting and dinner in New York on December 11th. The banquet to which many prominent railway officials have been invited, begins at 7 P. M., promptly, at the Waldorf-Astoria Hotel. The speakers for the evening are to be Mr. Howard Elliott, chairman of the Board of the New York, New Haven and Hartford Railroad, and the Honorable James M. Cox, Governor of Ohio.

Each year these annual dinners of the Railway Business Association have been more fully recognized as an economic event of unusual significance. Speakers on each occasion have been men of prominence and recognized authority in their respective fields, and their broad gauged discussions of current railway problems have proved an important contribution to the effort constantly being made to solve such problems in a manner which will prove beneficial both to the railroads and to the public.

Not satisfied with the influence of these annual banquets, the Railway Business Association during each year of its existence

Digitized by Google

HOWARD ELLIOTT,
Chairman of the New Haven Board.

GEORGE A. POST,
President of the Railway Business Association.

HONORABLE JAS. M. COX,
Governor of Ohio.

Mr. Elliott and Governor Cox are to be the principal speakers at the fifth annual banquet of the Railway Business Association to be held in New York on the evening of December 11th.

has been actively engaged in conducting certain investigations, the results of which have been put in bulletin form, widely distributed, and have undoubtedly had their effect in the enlightenment of the public mind. In fact, the influence of this great organization, which numbers among its membership many of the most prominent business enterprises of the country, has been of such a definite character as to leave no doubt as to its practical value. Trade organizations, in particular, have felt its influence, and many of the resolutions which have been passed within the past year or two, demanding a more liberal treatment for the carriers, can be attributed, to no small extent, to the effective activities of this Association.

The forthcoming banquet is likely to prove one of the most notable in the history of the organization. In a notice recently issued to its members concerning both the meeting and the dinner, the following brief statement is made regarding the speakers:

In Mr. Elliott the Association will be so fortunate as to hear the man who has been summoned to solve a problem of extreme difficulty in railway operation and in winning the confidence of the public. Through achievement in the Southwest and in the Northwest he attained by ability, character and temperament a leadership of first magnitude both in management and in public relations. In honoring the Railway Business Association by speaking at its dinner he will move among hosts upon whom in their individual activities he must lean for the physical instruments of transportation, and to whom in their organized endeavor he may look for moral support. The problem of gaining the popular good will for the railways brought the Railway Business Association into existence. In our pulpit Howard Elliott properly stands to deliver an address to the American people.

Mr. Cox, experienced in business as a publisher, trained in economics as an editor, twice representative in Congress and now Governor of the great State of Ohio, has displayed in public life a fusion of generous altruism with hard-headed concern for the stability of industry, commerce and transportation. His topic will be ideals in business, particularly the ideals which should animate employers, employes and the public in their relations one to another. Habituated to the practical task of solidifying the community for working co-operation, Governor Cox speaks plainly in advising modification of attitude by whatever element. James M. Cox will be at home in the Railway Business Association atmosphere of conciliation. His acceptance of our invitation to deliver one of his thoughtful, vigorous and snappy addresses is a high compliment to our organization.

In a recent statement made by Mr. Post, president of the organization, he called attention to the fact that the Railway Business Association has now been in existence five years, and that its constant effort has been that of conciliation between the railways and the public. He said:

We have in all that time constantly and systematically studied railway needs, railway practices, governmental policies and public opinion; and it is our belief that at the present moment the American people are prepared to a degree unknown in many years to consider railway problems with open minds and put themselves in the railway manager's place. Foolish enactments and shortsighted regulations may still be apprehended just as mistakes and shortcomings are still chargeable to some railways. Permanent advances take time but the people are willing to be shown, and their official representatives will eventually realize the intelligent scrutiny which their constituents are bringing to bear on all sides of railway questions.

What has increased the prevalency of this attitude? A combination of influences.

To begin with, the managers more than ever

Digitized by Google

before have studied public sentiment, endeavored to understand and sympathize with changing standards of public exaction and made evident to their communities a determination to meet the public desire in every reasonable and feasible way and furnish full explanation when compliance is withheld. Managers have come to recognize that they are salesmen of transportation and that just as the business man must deal fairly and agreeably with his customers in order to avoid loss of trade from competition, so the railway manager must employ like methods to escape damage from regulation conceived in retaliatory spirit.

A second factor has been the patient, persistent and thorough dissemination of facts upon phases misunderstood. Overcapitalization was at one time the bugbear of many shippers with whom our Association corresponded or conferred. Many persons still believe that capitalization should be a bar to readjustment of freight rates, but there are few business men of prominence and influence nowadays who do not understand that American railways pay a much smaller return to capital than roads in other countries, that the chief reason for this has been the expenditure on the property of surplus which foreigers commonly distribute in dividends, that the freight rate is made not to yield a specific amount of revenue, but in order to move business which will add to the prosperity of the region and hence of the railway. Shippers now more generally appreciate that service is more important than rates and that a railway company, instead of being an inexhaustible barrel of money, is a business enterprise whose expenses nearly equal and sometimes exceed its receipts and which can only provide good cars and plenty of them, with quick movement, if its net earnings place it in position to do so.

Railway credit, too, is beginning to be comprehended. Five years ago most shippers and public men with whom we exchanged ideas seemed to think the desired advance in freight rates was to be used to pay higher rate of dividends to the stockholders. It has been an important task to impress upon them so that it might become a habitual thought that the main necessity is the sale of new securities for providing improvements and additions and that the new revenue would either go wholly to buyers of those securities or serve to bring a lower return on outstanding securities up to a rate which would make new issues attractive. The most hopeful sign is the growing appreciation that whether increased revenue is spent directly for improvements or indirectly in raising new capital for improvements, in either case the shipper is paying money to provide himself with facilities.

In various ways business men are manifesting their willingness to consider without prejudice the advance in rates now proposed for the Eastern roads. A symposium in the *American Lumberman* embraces replies from twenty-six concerns, of whom only nine oppose the advance, while five are open to conviction and twelve are in favor, the latter including two recent presidents of the National Wholesale Lumber Dealers Association, F. R. Babcock, of Pittsburg, and F. E. Parker, of Saginaw, Mich. Resolutions favoring the advance have been adopted by the Michigan Manufacturers Association, the New Jersey State Chamber of Commerce by referendum and by prominent organizations in St. Louis, Cincinnati, Columbus, Pittsburgh, Philadelphia, Baltimore and other cities.

Among the journals which did not advocate the advance in 1910 and now urge it are the *Chicago Tribune* and the *Saturday Evening Post.*

The Interstate Commerce Commission may feel, as it is entitled to, that if its investigation shows the need of larger revenue, a strong body of public opinion will be found approving a favorable decree.

A GRADUATED FREIGHT RATE

The traffic manager of a great industrial enterprise located at Pittsburgh, has recently prepared an article on the heavier loading of cars. In this article it is pointed out that while there has been a great increase in the capacity of freight cars within recent years, such increase has signally failed to accomplish a proportionate increase in the average load. The author then proceeds to develop a plan whereby this difficulty may be overcome and the solution to the whole problem, from his point of view, appears to rest in a system of graduated minimum weights both for carload and less-than-carload lots with a correspondingly graduated scale of freight rates. To quote from the article:

> The traffic officials of the railroads have it in their power to really solve this question in a very simple manner by issuing graduated commodity rates based on increased carload minimum weights, i. e., commence on the present basis of rates, with the present minimum weights, and have a table of higher minimums with lower rates.
>
> For instance, from Seattle to New York the table of rates on lumber could be made as follows:

Minimum Weight	Rate
300 pounds	$2.25 per 100 lbs.
1000 "	2.00 " 100 "
2000 "	1.75 " 100 "
10000 "	1.50 " 100 "
20000 "	1.25 " 100 "
30000 "	.85 " 100 "
40000 "	.75 " 100 "
60000 "	.60 " 100 "
80000 "	.50 " 100 "

> The present freight rate on lumber from the Pacific Coast to New York is 75 cents per 100 pounds with twenty-five or thirty minimum carload weights, that are based upon the cubical capacity of the car, and the less-than-carload rate is $2.25 per 100 pounds.

Of course railway traffic officials will recognize that these suggestions contain no new thought in freight rate construction, but the author has evidently overlooked a number of important points in the development of his plan which have long been considered practically unsurmountable by traffic officials.

Digitized by Google

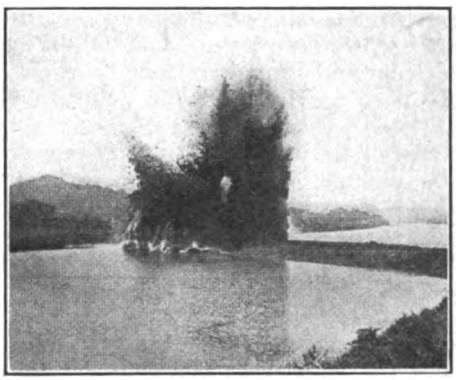
In the first place, graduated rates, such as the author proposes, would tend to increase the advantage of the large dealer over his less fortunate competitor and thus be in direct opposition to the principles which have largely governed the activities of political bodies within recent years. In other words, a graduation of rates would tend to perpetuate and increase the power of so-called trusts and big combinations. Admitting that the carload rate gives an advantage to those who are able to ship in carload quantities, this single division has largely thrown the country's industries into two distinct groups, each group of which can at least compete on an equal basis so far as freight rates are concerned. Should the graduated rates be employed, however, it would work unbearable hardship to the smaller dealer whether he be wholesaler or retailer and in innumerable instances would undoubtedly drive him out of business. Such a tendency is un-American and certainly would not be considered for a moment by the present regulative authorities.

No one desires more than the railways, that cars shall be loaded to their maximum capacity as this would mean greater economies in practically all branches of the service. It also may be that the author's point is well taken that loading of cars to their full capacity entails an extra loading expense which the shipper does not feel called upon to assume, but this could not fairly be met by a graduated rate such as the author proposes, particularly as the decrease involved would be likely to offset many times any additional expense occasioned by loading the car to capacity. Whether the author realizes it or not, many railway officials and shippers in the past have tried to excuse the practice of rebating with practically the same argument and while, in this case, the favor was often granted to the individual, in the case of the graduated rate it would only be transferred to a favored class, which would make it, to a degree at least, as obnoxious. Present regulative tendencies are to simplify and equalize freight rates, not to add to their complexities and inequalities, and the author's plan, therefore, is one which would hardly receive the endorsement of those in authority.

Furthermore, to upset the present rate schedules in the manner he suggests would bring about chaotic conditions both in and out of the railway service and would undoubtedly seriously disturb the credit of the railways at a time when such credit needs every protection possible. The author suggests that such a graduation of rates would practically mean an increase in the income of the railways but such suggested schedules as he presents in his article, or his rather vague references to the economies which would result from a greater capacity loading of freight cars, do not appear to sustain his contention. As a matter of fact, such a graduation of rates could mean only a sharp decrease in such rates, with no guarantee that this could be offset by the greater economies which would be affected. As the crying need of the hour is a substantial increase in rates, it is hardly a propitious time to attempt an experiment of this character.

AN HEROIC ACHIEVEMENT

The Panama Canal is receiving its final touches and within a comparatively short time will be thrown open to the fleets of the world. The United States is justly proud of this stupendous achievement not only because it represents the greatest engineering feat in all history but because, in its building, this country has demonstrated its ability to complete a task at which other nations had failed. Furthermore, the manner in which the task was performed, has set an example which cannot but prove stimulating to all mankind. While discipline among the employes of the Canal Zone has been rigid, it has not been unmixed with sympathy and has always been guided by absolute justice. Graft has been an unknown factor, and the civic development in a region where sanitation and right living were practically unknown, constitutes one of the remarkable features of the work.



DESTROYING THE LAST BARRIER BETWEEN THE ATLANTIC AND PACIFIC OCEANS BY BLOWING GAMBOA DIKE.

Digitized by Google

(Illustration from the *London Graphic.*)

LOCATION OF THE PANAMA LAND SLIDES WHICH ARE STILL EXPECTED TO CAUSE SOME TROUBLE BEFORE THEY ARE EFFECTUALLY CHECKED

In the RAILWAY WORLD of October, attention was called to the passage of a lone steamer through the Gatun Locks on September 26th. On October 9th the west flight of these locks were used for a second time for lifting three groups of dredging vessels and a floating pile driver in tow of tugs; in all, thirteen vessels. A few days later, on October 14th, the first lockage on the Pacific end of the Canal was affected when a tug, steam launch and three barges were raised together through the west flight of Miraflores locks from the Pacific entrance channel to the surface of Miraflores Lake. While considerable is still left to be accomplished before the Canal will be available from end to end for large vessels, the work is so nearly completed as to preclude any chance of serious delay.

The only possible delay which may occur in the completion of the Canal rests in the danger of a continuation of the slides which have occurred at three places along its banks. These slides, in the opinion of some engineers, are likely to continue for some time to come, although it is believed by those in charge that they will be able to maintain a channel of sufficient width and depth for large ships and that such as may occur in the future will not delay the completion of the Canal, nor will they seriously interrupt the passage of vessels through it after its completion. Efficient machinery for excavating and dredging is constantly on hand for this purpose.

In the meantime, across the Continent at San Francisco, work on the Exposition which is to celebrate the completion of the Canal and which is scheduled to open February 20, 1915, goes rapidly forward. Reports from the Pacific Coast state that the Panama Pacific International Exposition is more than two thirds completed.

The estimate is based upon the total amount of work necessary in the complete preparation of the Exposition. Every department of the Exposition is pronounced by executives familiar with the organization of universal expositions to be further advanced than were those of any of the greatest expositions held in America at a similar pre-exposition period. Twenty-seven of the world's nations have accepted the invitation conveyed through the Department of State; this record is unprecedented at a time one year and one half before the opening. Thirty-five states have selected sites for state pavilions. Almost seven thousand applications for concession privileges have been received. The applications for exhibit space would, if all were granted, exhaust the entire exhibit area.

Construction is far advanced. The most difficult part in exposition building is past. An immense amount of preparatory work has been accomplished. Ten of the fourteen huge exhibit palaces are now under construction. One building, the Service Building, is completed. Contracts for three additional buildings will be let within a short period.

According to the *American Review of Reviews* it does not now seem likely that the Exposition will suffer very much from lack of representation from British or German industries. A movement of British merchants and manufacturers, similar to that engineered in Germany by Herr Ballin, of the Hamburg-American steamship line, has now been set on foot in England. The League of Industrialists, Germany's foremost organization of manufacturers, at its annual convention in Leipsic, late in September, unanimously decided to support a private movement for German exhibition in San Francisco. Official acceptances of invitation to participate have now been received from France, Holland, Portugal, Spain, Sweden, Denmark, China, Japan,

Digitized by Google

Canada, Mexico, and practically all the other Latin-American republics.

Appropriations by state legislatures range from $35,000 in North Dakota to $700,000 in New York, making a total of appropriations by state legislatures of more than $8,000,000. Among the many interesting new features will be the working out of a color scheme of the famous artist and illustrator, Jules Guerin. There will be no white at the Exposition. Instead there will be vermilion, yellow, and orange in various shadings. There will be no purple or blue. The sea and the sky will furnish these. Moreover, the predominant color in the buildings will be the artistic blend of pink and yellow which made the Roman Parthenon and the Greek Acropolis so impressive.

PUBLIC STATEMENTS BY PROMINENT OFFICIALS

On the platform and through the public press, prominent railway officials continue to discuss railway problems in an effort to assist the public to a fuller appreciation of the difficulties which confront present day railway management. In discussing the possibilities of government ownership, Samuel Rea, president of the Pennsylvania Railroad, is reported in the public press to have recently made the following statement:

There is bound to be a divergence of opinion regarding Government ownership of railroads. We are in a period of dissatisfaction and criticism of the entire political and social structure, and sound conclusions cannot be reached without clear thought and careful consideration. There are two sides to the question. Government ownership is bound to come quickly if, by continued state and federal legislation and commission orders, railroad control is assumed without the responsibilities of management. The results are evidenced by restriction of railroad earnings, by increase of railroad expenses, over which the railroads have no control, by laws ordering extra and unecessary train crews, elimination of grade crossings without the states or municipalities co-operating and participating in the cost, the public improvements demanded by way of steel cars, station improvements and better facilities, the heavy increase in taxes, higher wages and greater cost of everything pertaining to railroad operation.

Therefore, while the railroads have furnished liberally large amounts of capital for improvements, it is a fact that these large expenditures in the past few years have earned little, if any, return, and unless conditions change and the railroads are impartially and fairly dealt with private capital cannot much longer be induced to provide the tracks, terminals and equipment demanded by the business of the country. Railroads, consequently, must restrict their programs to improvements and operations to accord with that condition. Then, whether the results are justifiable or not a universal demand may come for the nationalization of railroads by compelling the Government to do what private capital can no longer be induced to do.

There is a strong other side to this question. The constructive side of the sober judgment of the country will reassert itself. Within a comparatively few years there would be, in my judgment, a demand to return to private ownership and management of the railroads of this country, because I believe the venture would be unsuccessful and wasteful, and because government activities and credit would, in view of the world-wide demand for capital, be found insufficient to meet the pressing demands from every part of this large and growing country to improve living and agricultural conditions, foster commerce and other measures to insure national progress.

All intelligent citizens realize that government ownership could not control more effectively the railroads than present strict state and federal regulation, accepted and supported in good faith by the railroads. The nation at large will demand similar control by the federal, state and municipal governments against the extravagant expenditures for non-productive projects, which are afterward expensive to maintain. Public opinion finally will assert itself by repealing unnecessary, punitive and unwise legislation against the best interests of the railroads, their employes and the public. Time will bring a due appreciation of the great work, and of the present honest and efficient management of the railroads, and their great share in making and continuing the prosperity of the country. I confidently hope that the earliest evidence of public confidence will be unanimous approval of the small rate increase now requested by the railroads.

President Ripley, of the Atchison, like President Rea, of the Pennsylvania, sees ultimately no escape from government ownership, unless government regulation deals in a fairer manner with the carriers in the future than it has in the past. He says:

A system whereby private individuals furnish money, but have practically no voice in the management, may go along temporarily and by previously acquired velocity, but cannot long endure.

The certain result will be Government ownership of railroads. Few want this now, and practically everybody realizes it would be about the worst thing that could happen to the Government.

When railroads fail to give the public all it wants, as they will under present conditions, there will come the demand that the Government step into the breach.

But while it comes a little late, it is pleasant to observe that the chairman of the Interstate Commerce Commission has at last observed that Congress and the states assisted by the body over which he so ably presides have at last brought railroads to the point where they can go no further.

Do not infer that I am opposed to some regulation of railroads. Even the Interstate Commerce Commission law with all its crudities and absurdities has by no means been unmixed evil. A rate making commission elected by popular vote is manifestly and inevitably partisan and the com-

Digitized by Google

mission appointed by an executive officer is usually merely a reward for political activity, so chances for impartial judgment are small indeed. A commission appointed with a sole view to fitness and capability and for long terms with good salaries should be of much use to the public and railroads, this applying particularly to state commissions.

President J. M. Fitzgerald, of the Western Maryland Railway, in a speech on November 13th, at the banquet of the Railway Development Association held in Baltimore, illustrated forcibly the necessity for higher rates for transportation if the carriers were to be placed in a position to provide adequate transportation facilities for the prompt movement of agricultural and other products. Mr. Fitzgerald made it plain that the present rates of compensation received by the carriers are no longer sufficient to meet the increasing costs of operation, and that it was an admitted fact that the railways cannot properly shoulder the burdens of higher operating expenses unless they are permitted to advance rates.

Irving T. Bush, president of the Bush Terminal Company, recently had the following to say regarding the necessity for the proposed increase in railroad freight rates:

The great trouble with restrictive legislation which has been passed in this country in regard to transportation is that it has defeated the aims which it was proposed to further, and has encouraged certain abuses which it was intended to prevent. When the national, state or municipal government steps in to control certain business, and thereby drives private capital away, that government has either to supply the means of commerce and business or it is going to be a hurt to that particular commerce or business.

IRVING T. BUSH,
President of the Bush Terminal Company.

With this great country and its growing needs for increased transportation facilities, the legislature has made it impossible for new developments by private capital. The Government has practically taken control of the railroads, and has thereby put a stop to further investments of private money in the extension of railroads. This has practically defeated the end for which the legislation was intended, the agitation having come principally from the West. The West is in need of further transportation developments, and westerners are beginning to realize that the Government is not doing much to that end, while it has put a stop to private enterprise in that direction. Westerners are therefore, themselves, the greatest sufferers. The place must soon be reached where the Government will cease to permit increases to operating expenses without a relative increase in rates.

President Finley, of the Southern Railway Company, in speaking on "The Relations of the Railways to Southeastern Development," at Knoxville, Tenn., on October 21st, had the following in part to say:

I am satisfied that, from whatever viewpoint we may consider the railways of the Southeast, we will find that rail transportation is an essential part of every business enterprise in the section. I may even say that it is the most important single factor in business, because distribution is essential to the largest and most profitable development of every business enterprise. Without transportation the market for any commodity would be limited to the locality of its production. The railways and other distributing agencies bring producers into touch with the markets of the world. For this reason public opinion should not sustain unjust treatment of the railways any more than it would sustain injustice to any other part of the business structure of the Southeast. The railways are so intimately linked up with every business enterprise in the Southeast that any injury inflicted on them will react upon the whole body politic just as certainly as an injury to any part of a man's body will injure the man.

The ability of the railways to carry the constantly increasing products of the section to market has been in great measure due to a larger and more efficient use of their facilities. There is, however, a limit beyond which any machine or plant can not be efficiently operated and, if the volume of traffic in the Southeast is to continue to grow in future years at the same rate as in the past, an increase in railway facilities will be essential to the satisfactory marketing of the products of farms, forests, mines and factories.

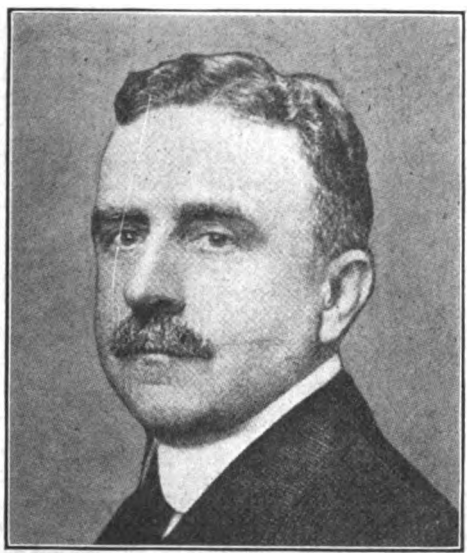
ANNUAL MEETING OF NEW HAVEN

At the annual meeting of the New York, New Haven and Hartford Railroad, held at New Haven, Conn., on October 22d, the stockholders elected James L. Richards, president of the Boston Consolidated Gas Company, and Galen L. Stone, of Hayden, Stone and Company, directors, to succeed Theodore N. Vail and Alexander Cochrane, who resigned so that they might remain directors of the Boston and Maine. Other directors were re-elected. The stockholders also approved the annual report.

After the stockholders' meeting the directors elected Haward Elliott chairman and James H. Hustis president.

The new Executive Committee consists of: William Rockefeller and J. P. Morgan, New York; Charles F. Brooker, Ansonia, Conn.; William Skinner, Holyoke, Mass.; Arthur T. Hadley, Howard Elliott and James S. Hemingway, New Haven, Conn.; Robert W. Taft, Providence, R. I.; Thomas Dewitt Cuyler, Philadelphia, and W. Murray Crane, Dalton, Mass.

Several new names were added to the Board of Directors, which has a membership of twenty-seven, fourteen of whom are residents of Connecticut. Those re-elected from the existing Board were: William Rockefeller, C. F. Brooker, Edwin Milner, William Skinner, D. Newton Barney, R. W. Taft, J. S. Elton, J. S. Hemingway, A. H. Robertson, F. F. Brewster, H. K. McHarg, J. L. Billard, G. F. Baker, T. D. Cuyler, Edward Milligan, F. T. Maxwell, Samuel Rea, Laurence Minot, M. F. Plant, J. P. Morgan, Howard Elliott, Arthur T. Hadley and Murray W. Crane.



JAMES H. HUSTIS,
The new president of the New Haven System.

The new men are: J. H. Hustis, John T. Pratt, of New York; James L. Richards, of Newtonville, and Galen L. Stone, of Brookline, Mass.

After announcing the vote for directors, Chairman Elliott, in an address to the shareholders, announced that the dividend would have to be cut to four per cent.

He said: "The past is gone. You stockholders and the management have a magnificent property to take care of. We must all pull together for the best interests of the New Haven road and the territory it serves.

"There is no use mincing matters. The dividend will have to be cut to four per cent. Gross earnings have fallen off and expenses have advanced. We hope to be able to maintain a four per cent dividend from now on and to do better in a year or two. It is better for you stockholders to suffer now than two or three years from now."

The New Haven has come to an agreement with the conference committees of the Brotherhoods of Locomotive Enginemen and Firemen with regard to the revised rules recently issued by the road governing the working conditions. The following statement has been issued by the management:

"After several conferences between the committees representing the engineers and firemen and one representing the management, rules were agreed to which will be issued at once. This schedule embraces all the principles for which the management contended, as well as all the safeguards against possible misinterpretation for which the men contended.

"The outcome is satisfactory to both management and men. It was not possible that it could be otherwise, when safety only was involved. The management is assured that it is to have the earnest co-operation of the men, as well as of the organization in bringing about not only a safe but an improved service. It accepts this assurance in good faith. With men and management in accord in a common purpose, the outcome should not be in doubt."

Contemporary Opinion

Railroad Nationalization.

(From the "Wall Street Journal.")

"CLIFFORD THORNE, who plays St. George to the railroad dragons of Iowa, is a man of engaging personality and much earnestness. He told the Convention of Railroad Commissioners in Washington that the Government could take over the railroads of the country for the par value of their stocks and bonds, fund the purchase at three per cent, raise the pay of employes $100,000,000 a year, and still have enough surplus earnings left to spend on improvements three times as much as railroad men say the country needs. Yet Mr. Thorne says he is not in favor of Government ownership. Why?

"Aside from several mountains of vexatious questions which for the moment he allowed his imagination to soar over, Mr. Thorne may have been subconsciously aware that the railroad payroll is $1,300,000,000 annually, that his $100,000,000 additional would be an advance of 7.7 per cent, and that such a niggardly concession from a rich and generous Government would not stay the demands of the brotherhoods, especially their demands upon a Democratic State, for more than six months. Witness what happened on the Western Railway of France after nationalization, where two years after purchase by the State, annual earnings had increased $2,316,000 and expenses $6,349,700, reducing net profits by $4,033,700, a loss of nearly one-third.

"Possibly Mr. Thorne had also in mind the fact that no government of Europe enjoys a three per cent credit except Great Britain, which owns no railroads. On what interest basis the United States could raise $16,000,000,000, nobody knows. Of our $960,000,000 national debt, all but $50,000,000 enjoys the "circulation privilege," which creates for the bonds an extra investment value. The Panama bonds not eligible to secure national bank circulation are three per cents, and their bid price in the market is 99. Mr. Thorne may have based his assumption as to the nation's credit in such a transaction on that fact, but if so he needs to remind himself of the difference between the borrower of $50,000,000 and the borrower of $16,000,000,000.

"It is true that the transaction Mr. Thorne describes would not involve the raising of sixteen billions of wholly new capital, in addition to the country's present fixed investment. It would mean, however, the shifting of that volume of capital from investments paying from four to seven per cent and averaging above five per cent to a single form of investment paying a flat three per cent. Now, one of the troubles that beset the railroads to-day is the persistent refusal of capital to go into good securities at, say, 4½ per cent while rather inferior securities yielding five to six per cent find a comparatively good market. In the face of this fact and the recent experience of such borrowers as New York City and even New York State, is it reasonable to assume that the owners and creditors of the railroads stand ready to give up something like $350,000,000 a year for the security of principal that a railroad-owning Government might afford? No borrower, whether individual, corporation or government, ever largely increased his indebtedness without affecting his credit."

To the above the "Wall Street Journal" might have added another statement found in a letter recently written to Mr. Thorne by President E. P. Ripley, of the Atchison. In his letter, Mr. Ripley declares that Mr. Thorne made an error of more than $200,000,000 in attempting to show the savings possible under government ownership of railroads, by using gross interest and dividends declared by railroads, instead of net interest and dividends actually paid, when he said that $464,140,210 of the return now paid annually to railroad capital could be saved under public ownership.

To any one who has even the dimmest appreciation of the situation, Mr. Thorne's statements are so preposterous as to be unworthy of even the scantest consideration. The unfortunate results from such grossly unreliable utterances rest in their effect upon the public mind which is largely uneducated along such lines and which generally accepts, without reservation, the statements of its public officials. While big business may need regulation and while the same may be true of the railroads, the crying need of the hour, judged by the public utterances of some government officials, is a keener appreciation on the part of such officials of their real responsibility to the public and the development of a moral fibre which will place them above the temptation of deliberately misleading the people.

Tariff Changes Summarized.

(From "Review of Reviews.")

"AN examination of practically all the changes in rates shows 938 reductions of duty, 86 increases, and 307 rates unchanged. This is a fair epitome of the changes just enacted by Congress. Fifty-one of the 86 increases fall in the chemical schedule. Most of the increases in this schedule affect balsams and essential oils used in the manufacture of perfumes, and were justified on the ground that perfumes into which they enter will enjoy the extraordinary high duty of 75 per cent, being a luxury containing alcohol. The other increases affect mostly articles classed as luxuries by the authors of the tariff, such as perfumes, gold and silver wares, diamonds, precious stones, pearls, manufactures of fur, some varieties of nuts from the tropics, spices, etc.

"Most of the rates left unchanged fall in the tobacco, spirits, chemical, agricultural and sundry schedules. Included in the latter are laces, embroideries and dress trimmings, which are regarded as luxuries and will continue to be dutiable at 60 per cent ad valorem.

"Much confusion will prevail from the loose and unscientific classification and wording of many provisions of the new law. These will find no solution except through the painful and costly settlement of the vexing questions by the courts.

"Space will not permit of discussing the ad-

Digitized by Google

ministrative features of the law, which have gained added importance through the great extension of the ad valorem system of duties; the clauses dealing with further reductions of duty through reciprocity and with retaliatory duties against foreign discrimination, as well as the section relating to the income tax can not be discussed at present for the same reason.

"It is impossible to give an accurate estimate of the aggregate tariff reduction in terms of the probable falling off of revenue. The so-called estimates of the House and Senate committees are mere guesswork. Nor is it necessary to engage in this pastime in order to gain a proper appreciation of the character of the change. The test of the new tariff will lie in the extent to which increased foreign competition will be met by reduced prices at home granted to the consumer not at the expense of reduced wages, but through increased efficiency of self-sustaining industries."

Reason Is Again Returning.

(From the "Stockton (Cal.) Evening Mail.")

"IT is to be hoped that the day of mere prejudice has passed in California, and that hereafter all differences will be settled on an equitable basis. It must be remembered that the railroads have done a great deal for California and are entitled to reasonable interest on the capital they have invested. And it might be said parenthetically that reasonable interest can be secured without injustice to the shipper.

"Above all things it should be borne in mind that railroads are not great automatons existing independent of humanity, but simply an aggregation of business men who have pooled their funds for the common benefit. Many of the stockholders are people in ordinary circumstances: they are not all scheming millionaires, as many seem to think. For example, the Pennsylvania Railroad has 85,310 stockholders, or partners, and nearly 48 per cent of them are women. Not long ago this road distributed $7,408,082 dividends among its stockholders."

Safety on American Railways.

INTERESTING illustrations of the great degree of safety attending travel on American railways are given by a prominent newspaper in an article based on Interstate Commerce Commission figures which show that during the six year period, 1905-1911, only one passenger out of every 74,736 received injury of any kind and only one out of every 2,275,123 was killed.

Commenting upon these figures this paper says:

"A typical journey for all roads in the country is now 34 miles, and there are taken on the average 2,275,122 such journeys in safety to each journey which results fatally. If a man were to ride out these 2,275,122 safe journeys at two per day for each business day in the year, it would take him 3,792 years. To have begun in time to meet his death in 1914, he would have had to start in the year 1778 B. C., 458 years before Moses led the children of Israel through the Red Sea. By 750 B. C., when Romulus was "regulating" Remus by modern methods, the commuter would have ridden 21,000,000 miles, and have had 56,300,000 yet to do. When Phidias, in 460 B. C., was carving the Olympian Zeus, our wayfarer would have been but one-third of the way toward his death; and even in the year 890 A. D., when Alfred the Great was letting the griddle cakes burn, this traveler would have spent the equivalent of 207 years on the trains running at 30 miles an hour, and would have had 87 years more of actual travel to spend before meeting his fatal accident."

Use of Signals on Electric Roads.

THE "Electric Railway Journal" of New York takes a decided exception to the suggestion that electric railways could profit by the experience of the steam roads in the development and use of signals. It is asserted that the boot is entirely on the other leg and if there is one particular thing in which the electric roads are in advance of the steam roads, it is in the maintenance of signal facilities. To quote from the editor of the "Journal":

"The statement that electric railways are in position to, and should, profit by the experience of steam roads in the development and use of signaling systems has been made so often that it is commonly accepted as a matter of fact. There is one particular, however, in which steam railways can learn something from electric roads, and that is how best to maintain signaling facilities.

"It is almost a universal custom among electric railways which have signals to require their maintenance to be handled by the department which looks after the overhead and power facilities. This puts the signal maintenance in the hands of the men who are already handling electrical work and are familiar enough with it to be able to assimilate the added labor of caring for the applications of electricity which the signals represent.

"It is true that hardly any signals except such as are electrically operated are used on electric railways, but the fact remains, nevertheless, that these roads have shown a much better appreciation of the fitness of things in keeping all of their electrical facilities under the eye of an electrical department than steam roads have in trying to combine the maintenance of signals with maintenance of track. Steam roads have had for many years a department in charge of their telegraph and telephone facilities, which corresponds in a way to the overhead department on electric roads. But instead of trying to work out a combination of the telephone, telegraph and signal maintenance, which undoubtedly could have been made successful, they seem to be endeavoring to combine two kinds of labor which are distinctly incompatible.....

"Electric railways seem to have arrived first —and without straining—at the best solution of the difficult problem of how to maintain signals most economically. And in this respect, at least, steam roads have something to learn from electric railways— even though the latter may be indebted to the former for much of the pioneer work that has been done in connection with the engineering problems of signaling."

Digitized by Google

The Situation in a Nut Shell.

(From the "Chicago Evening Post.")

"DURING July, 1913, the railroads of the United States received 4.4 per cent more money than they did in July, 1912.

"But it cost them 8.5 per cent per mile more to operate.

"These are the figures of the bureau of railway economics.

"Every bit of statistics seems to strengthen the reasonable demand of the roads that the increase of their expense due to governmental regulation be balanced at the other end of the scales. There must be some "give" in the structure somewhere, else the pressure will wreck it."

The Arbitration Award.

(From the Philadelphia News Bureau.)

"IT would be unwise to draw any hard and fast conclusions as to the superiority of the amended Federal arbitration act over its predecessor from the results of the first arbitration conducted under it. Certain initial difficulties of the present case it did solve, but there is as yet no assurance that similar difficulties will not recur and otherwise this arbitration resembles those that have gone before. The rule still holds that arbitration of wage controversies is predestined compromise in which one of the parties has much to gain and nothing to lose. An arbitration in which it shall be judged on a large scale, that the employes are not entitled to any increase of wages remains wholly a matter for the imagination.

"Nevertheless, certain points of accomplishment stand out in the findings of the board of which Seth Low and John H. Finley were the neutral members. The award properly confirms and emphasizes the principle enunciated by the Straus board in the case of the enginers that the compensation does not depend upon what the companies can afford or upon any particular level of rates, but solely upon what the work is worth. The dissenting opinion of the railroad members itself is an unintentional confirmation of this view, pointing out as it does that the claim of labor upon revenues is superior to that of dividends or even interest charges. There is nothing to indicate that this relation was ignored in the framing of the majority finding.

"Without attempting to say whether the railroads involved need an increase of freight rates, the board makes a clear exposition of the relation of wages and rates. It awards wages "that this board believes to be due at the present time," leaving to the Interstate Commerce Commission the consideration of freight rates in relation to expenditures for safety and efficiency. It affirms that "any policy which would make it impossible for the railroads to command this money (that necessary, to install safe equipment and adequate facilities) would be a profound misfortune to the whole nation," but it does not fall into the arms of either the carriers or the shippers by deciding that the nation is or is not pursuing such a policy. The board ventures only so far as to say that the lowest average level of freight rates in the world is not justly to be treated as a perpetual limitation upon what the men may receive.

"If the railroads are dissatisfied that the result is another increase in operating expenses, they may be thankful that the board has recognized the inevitableness of "over-time" and refused to penalize the carriers therefor; and that it has laid down the new principle that increased productivity of railroad plants has come from multiplication and development of facilities and "not to any measurable extent from the labor of conductors and trainmen." The fact that the board treats the present increase as the last of an old cycle of advances, instead of the first of a new cycle, is at least an intimation that railroad wages may have reached a level of rest under existing circumstances.

"The award is admirable in the restraint with which the board confines itself within the clearly defined lines of its authority. On the whole, it helps to clear the somewhat murky economic atmosphere in which the railroads are struggling to find their way."

Avoidable Accidents.

(From the "Great Western Employes' Magazine.")

"AS long a strains are operated on railroads, and, no doubt, in the far and distant future, when the ingenuity of man shall have solved the problem of aerial navigation and shall have conquered the laws of navigation to such an extent as to carry immense cargoes in the air, and so on through the various cycles of development to the end of time transportation will continue to exact its toll in injuries and deaths among the men engaged as carriers; for there is now, and always will be, a certain percentage of unavoidable accidents that are beyond the control of mortal man; and this fact may be stated as due to the inability of man to look with certainty into the future and thus safeguard himself against unavoidable accidents or guarantee the protection of his fellows therefrom.

"On the other hand there are a large number of accidents and personal injuries during this day and age—by far the greater proportion of all accidents and personal injuries that are known to be due to avoidable causes—accidents and personal injuries that are due to the failure of the man to keep his mind upon the tasks of the ever present moment, thus neglecting to safeguard himself against those foolhardy acts that he recognizes as dangerous.

"The question naturally arises, Why will men continue to tempt fate by taking unnecessary chances? Why will men gamble with death and injury in the performance of their daily work? Surely not because the railroad man is below the average in intelligence—that is not the reason—it is because he has not as yet recognized the sign of modern successful railroading—safety always—the sign that is nailed upon every section house and roadway building upon the system, or if he has recognized it, has failed to practice it.

"The man who takes chances, the man who gambles with fate loses, as all gamblers must—sometime—and if he is injured he regrets his foolhardy act until the day of his death, and if he is killed as the result of taking a chance he has unnecessarily blasted the hopes of his

Digitized by Google

loved ones and brought the dark days of despair into his family circle.

"The safety movement is one of the most vital problems confronting the railroad men of this country; it is a means of preventing avoidable accidents; the unavoidable accidents cannot be controlled by the individual, but the accidents that are lurking behind all dangerous practices ready to pounce upon and destroy the victim of carelessness or thoughtlessness can be prevented.

"Safety Always—in case of doubt or uncertainty the safe course must be taken and no risks run is the keynote and the rule of success, and if each one of you will act accordingly, concentrating your thoughts upon your work and the ever present moment, keeping in mind the fact that eternal vigilance is the price of safety, if you will practice safety, talk safety, teach safety, you will not only secure safety for yourself and protection for your loved ones, which is important, but you will make the world a better place in which to live by securing the safety of others."

Big Business and Regulation.

(From "Engineering Record.")

DISCUSSSING "big business" in its relation to industrial prosperity before the American Mining Congress in Philadelphia, last week, Dr. Charles R. Van Hise, president of the University of Wisconsin, laid emphasis on two points in the trust problem which, while not new, deserve occasional emphasis, for one of them is an index to the inexorable laws of large industrial development, while the other points to a frame of mind which must be changed before there will be fair treatment of the whole problem. Referring to the mining industry, Dr. Van Hise pointed out that the competition enforced by the Sherman law has caused losses on zinc and lead in Missouri and Wisconsin mines as high as 45 to 50 per cent, while about 50 per cent of anthracite and bituminous coal is being left in the ground by the methods forced upon the operators by the competitive system. In other words, a law framed fundamentally to conserve the interests of the people is, by enforcing destructive competitive methods, nullifying this conservation, such as it is, by irreparable economic losses in other directions. As the New York "Times" said in discussing the address, "it is being learned at last that business makes laws which legislature cannot displace." The logic of Dr. Van Hise's remarks points plainly to regulation of monopoly in industry, just as to-day there is control of monopoly of public-service corporations. The other point in Dr. Van Hise's address to which reference is made needs no comment, especially after the attention given the subject in these columns last spring. It is pertinent to note, however, that it indicates the attitude of those upon whom we rely to do justice to the whole people. Referring to the rider in the sundry civil bill stipulating that no part of a $300,000 appropriation for enforcing the anti-trust laws should be used in prosecution of labor and farmers' unions he says: "I am willing to stand for enforcement of law when the law is enforced alike for all; but when somebody is picked out because he is in the front seat, or because it is good politics to attack him and allow 99 or 999 others to escape, I say that it is a profoundly immoral situation, and that is exactly the situation in this country."

Railroad Valuation.

(From "Railway and Locomotive Engineering.")

THE Interstate Commerce Commission has its work cut out for it, when it begins the task of the valuation of railroads. It is doomed to everlasting servitude, because it is enacted that it shall report to Congress at the beginning of each regular session until the task is done, and at the same time it shall report every change in values of every kind. It would be interesting to know by what kind of legislative juggling the job could be said to be done, while changes must necessarily continue to go on. Coming to the main question, however, which is really the only question: What is this valuation for? It is to find a supposed scientific basis for railroad rates—both passenger and freight. This cannot be done by the means proposed, for this contradiction is visible—if a passenger rate is rightly low in a crowded territory where prosperity flourishes, then a rate ought to be high where the population is sparse and poor and journeys necessarily long. Yet from the pocketbook point of view the crowded region could stand high rates better than the thin region.

When the enormous task of the Interstate Commerce Commission approaches completion and the Federal Government can prevail over all the jangling, confusing railroad laws of all the States, then it seems possible to foretell a general advance instead of a decline in rates, both passenger and freight; and for this reason: railroads must come to the point of providing out of earnings a sinking fund for reproduction and thus avoid everlasting dependence on the money market for bonds piled on bonds and obligations plastered on every decaying asset. The unwise agitation against railroads on one hand and the former indefensible independence of public service on the part of railroads on the other hand has reached its limit in this scheme. In the years that will elapse before the task approaches its first form of completion, the common sense of the railroad magnates must work out the idea of a sinking or replacement fund for property and "amortization" for the bonds; for indefinite extension of bonded indebtedness is impossible.

Who Owns the Railroads?

(From "San Francisco Post.")

WRITERS and speakers on the subject of the railroads' relation to the public are accustomed to draw a line between the two, as if the carriers were one thing and the public quite another and different thing. They err in the use of the word public, which is broader than a mere description of railroad patrons, for it includes not only the patrons, but the owners of the roads.

Twenty years ago, or even ten, the error would have been unimportant, as railroad securities at that time were held principally by institutions and a comparatively small number of large investors. This has been changed within the last

Digitized by Google

few years and the books of some of the biggest systems in the country at the close of the fiscal year last June, showed the number of stockholders had increased 100 to 1,000 per cent, since the panic of 1907.

Railroad officials who regard themselves as quasi-public servants look upon this extension of the list of owners with great enthusiasm. They see in it an end of railway baiting, for, as the president of one great line said recently, "every new stockholder means another thinker among the population." It is not the thinking population that makes unfair and impossible demands upon the railroads, but a careless, irresponsible element, led on by the demagogue.

Nowadays, nearly all the public has a direct interest in the financial conditions of the railways, by stock ownership or otherwise. Every man who has his life insured or takes out a policy on his house and furniture shares this interest. Every man who keeps his money in a savings bank shares it. Almost every college and charitable institution in the country holds railway securities. These facts, once made known to everyone, will surely bring an end to the forward attacks on the railroads.

Should Railroad Freight Rates Be Increased?

PRESIDENT WILLARD, of the Baltimore and Ohio Railroad, was the principal speaker at a meeting of the members' council of the Merchants' Asociation of New York, held on October 29th. The meeting was attended by a large number of leading business men who were informed by Mr. Willard concerning the present railroad situation and the importance of a favorable outcome of the movement before the Interstate Commerce Commission for an increase in freight rates in order that the carriers may maintain their credit before investors and thus secure the necessary funds with which to provide additional facilities for properly handling the growing commerce of the country.

Some 200 members and guests were present. William C. Breed, chairman of the council presided, and explained its purposes. The guests were: Daniel Willard, president of the Baltimore and Ohio Railroad Co.; Charles F. Daly, vice-president of the New York Central Lines, and George M. Shriver, vice-president of the Baltimore & Ohio. Others at the speakers' table were William H. Marshall, president of the American Locomotive Co.; Irving T. Bush, president of the Bush Terminal Co.; E. H. Outerbridge, and Wm. Fellowes Morgan.

DANIEL WILLARD,
President of the Baltimore and Ohio Railroad.

Mr. Willard reviewed briefly the reasons which led to the application of the railroads for an increase in freight rates in 1910; also, the conclusions of the Commission in that connection and called particular attention to the fact that in its decision the Commission dwelt at considerable length upon the facts that the railroads should not only be maintained in a high state of efficiency and be prepared at all times to move in a satisfactory manner the commerce of the country, but is also recognized the fact that conditions should be such as to invite such continued investment in railway securities as might be necessary from time to time to enable the carriers to extend their lines, add to and improve their facilities, in order to keep pace with the growing traffic of the country. Further that the Commission expressed the belief that the growing business of the country, together with such improved methods as the railroads might introduce from time to time, would result in sufficient net revenue to enable them to maintain the properties and procure the necessary additional capital and while those who represented the carriers in the proceeding referred to did not share the hopeful views entertained by the Commission, they none the less accepted the situation as best they might, and now—three years later—they are about to present their case again for consideration, and this time such arguments as may be advanced in support of their contention will be based upon the actual results which have taken place during the intervening period, and will not depend, as in the previous case, so much upon estimates and apprehension for the future.

With respect to the reasons leading the railroads to file tariffs providing for a general five per cent increase, Mr. Willard said: "When the railroads sought to advance their rates in 1910, the new tariffs prepared for that purpose contemplated an increase ranging from 8 to 20 per cent, chiefly upon the so-called class rates; but, during the hearing, it was frequently suggested and urged with much force that even though the railroads did require additional revenue, they ought not to obtain it by advancing some rates in large amounts while leaving others undisturbed. It was pointed out that the existing rate structure had been generally in effect for a long time and was the result of competition

Digitized by Google

over a long period of years, plus the influence also of a very considerable period of regulation by state and federal commissions.

"It was urged that the general business of the country had developed in harmony with the rate structure, and if the arrangement as a whole did not return sufficient revenue to fairly meet the requirements of the roads, it ought to be obtained by that method which would cause the least disturbance of existing commercial and industrial conditions, and it was in deference to this argument that the carrier in the present instance proposed an advance of five per cent on all articles. While it was felt that the sum of money that would be gained by such an increase would not be at all adequate to the necessities of the case, it was appreciated that the commercial adjustment of the territory involved was a very delicate affair, and it was finally decided to request a five per cent advance only, although all were of the opinion that a ten per cent increase was the least amount really adequate to meet the situation. It was thought that a five per cent advance of all rates, as proposed, would cause very little, if any, disturbance of existing commercial conditions, and if it should develop in the future that the amount so gained was not adequate, it was felt that the shippers and the public generally would be less opposed to a further increase, if necessary, after having had full opportunity to learn the effect of the smaller advance now proposed."

With regard to the lack of return to the railroads on the money invested in their properties in recent years, Mr. Willard said: "It is a matter of public record, as shown by the reports of the Interstate Commerce Commission, that during the fiscal years ended June 30, 1908, 1909, 1910 and 1911, the railroads of the United States increased their capital investment — not their capital securities, but their capital investment— something over $2,000,000,000; and it is also a matter of record that at the end of the fiscal year 1911, after paying operating expenses and taxes, the same railroads actually had about $8,700,000 less net from operation for return upon investment than was the case in 1907, although during the four-year period over $2,000,000,000 of new money had been put into the properties."

As demonstrating the particular condition at this time as typical of the situation in the east, Mr. Willard cited the fact that the case of the Baltimore and Ohio Company during the last three fiscal years, the net increase of property investment has been something over $55,000,000, but at the end of the last fiscal year, after paying operating expenses and taxes, the net earnings from operation applicable to return upon property investment, was actually $751,000 less than the sum so earned before the expenditure of the $55,000,000 mentioned.

Mr. Willard reviewed the increase in rates of pay of railroad labor, calling attention to the particularly high increase that had been granted the conductors and trainmen in 1910 and which had been in effect for a few months when the previous hearing was had; that since then there had been further increases granted the engineers and later the firemen through arbitration and that further demands of the conductors and trainmen are now before the arbitrators for adjudication; that the increases in rates of pay granted to all classes of labor on the Baltimore and Ohio since 1910, had added something over $4,000,000 to the cost of transportation on that road alone; that the price of coal and track ties had also materially advanced; taxes had increased and interest charges, due to increased capital investment, had been augmented $2,700,000.

He also pointed out that the freight rates in effect in 1910 had not in the aggregate been maintained and that a careful analysis shows that in the case of the Baltimore and Ohio the net result of adjustments already made means a substantial decrease in the return for the handling of business, and in summing up said that a conservative estimate was that the income of the Baltimore and Ohio during the last fiscal year was approximately $9,000,000 less than it would have been if the conditions had remained as they were at the beginning of the fiscal year 1910. "And the influences which have caused the changes mentioned are still at work," said Mr. Willard, "and it is reasonable to suppose that the same cause will produce the same effect."

As showing how some of these increased costs had been offset, Mr. Willard said: "It was urged at the former hearing that the railroads might very largely increase their net revenue by greater efficiency in operation. It was even suggested that the railroads in the country as a whole might in that way effect savings of as much as $1,000,000 per day. No railroad manager disputed the fact that greater efficiency was possible, and I suppose you as business men will admit that it is also possible to have more efficient methods in the operations of your own business, and the railroads are no exception in that respect.

"Speaking again for the Baltimore and Ohio, because I am familiar with its figures, I may say as a matter of information that during the past three years, this Company has made vigorous effort to increase its freight train load. That subject was given special consideration because it was felt that greater results could be achieved in that direction. The results obtained are reflected in the following figures: The average freight train load of the Baltimore and Ohio Company in 1910 was 442 tons; in 1913 it has been raised to 650 tons per train mile. The freight traffic moved by the Baltimore and Ohio Company in 1913, amounted to something over 14,000,000,000 ton miles. If the freight train load in 1913 had remained the same as it was in 1910, it would have required the running of over 9,000,000 more freight train miles in 1913 than were required on the higher train load basis, and assuming that the train mile so saved would have cost fifty cents, it is apparent that the direct savings accruing to that company, because of the increased train load, was something over $4,500,000.

"I feel that the Baltimore and Ohio Company has to some extent, at least, responded to the demands for greater efficiency, although I well understand that there is yet much that we can do in that direction. It should be remembered, however, that a very large sum of money was spent by that Company for larger cars and engines, and for other facilities, in order to accomplish the increased train load. I would not like to have it thought that the Baltimore and Ohio is an exception in this particular direction. I happen to know that the other companies have been giving as much thought to this same question, but not necessarily in the same direction.

Digitized by Google

It was possible for the Baltimore and Ohio Company to increase its train load; some of the others, perhaps, had already exhausted the possibilities in that direction, and consequently were obliged to look in other directions for results."

Continuing, Mr. Willard said: "This thought, I think, should be clearly understood by all. This nation has been developed upon the economic principle that we shall raise our wheat and obtain our coal and ore at those places where each can be produced to the best advantage, and having procured our natural products from the places where each can be obtained most economically, we then depend upon our transportation system to take the wheat, the coal and the ore from where each is produced to where each is wanted either by the manufacturer, or by the ultimate consumer. The effect of this policy is suggested in one simple comparison: The last figure that I have seen concerning the railroads of the German Empire, show that the Prussian railroads handled in 1909—606 tons of freight one mile per capita, while in the United States during the same year, the number of tons handled by the railroads per capita, amounted to 2844, or nearly five times the amount of Prussia. This shows the very great use which is made by our people of its transportation system."

Regarding the future, Mr. Willard said: "At the present time, because of the reasons I have already mentioned, railroad development and extension, particularly in the eastern territory, is practically at a standstill, and personally, I am quite unable to see how it can be otherwise until something happens to increase the net earnings of these carriers. I do not believe we can expect to accomplish the relief necessary by reducing wages, or by reducing materially the number of men employed, or by economics generally. Something, of course, may be accomplished in that direction. I do not believe that the relief required will be gained through increased business, because many of the roads are already handling as much, if not more, business than can be done economically with their present facilities, and before any greatly increased volume can be handled, large expenditures must be made for additional facilities. The railroads could probably mark time for a while, if permitted to do so, and by enforced economies they would undoubtedly be able to maintain their present payments upon capital invested. In the meantime, however, the industrial capacity would very soon overtake, if it did not overwhelm, the capacity of the railroads, and then further commercial development of necessity would cease."

In concluding, Mr. Willard quoted from a public address of one of the distinguished members of the Interstate Commerce Commission, as follows: "We can provide by legislation the sort of cars which a railroad shall use and the rates which it shall impose, we cannot by legislation force one single dollar of private capital into railroad investment against its will."

Effects of Train Crew Legislation

WITHIN recent years numerous bills to regulate the number of men that railways must employ in their train crews, have been introduced in the state legislatures and in Congress. These measures are commonly known as "full crew" bills and in the main have been vigorously opposed by the railways as unnecessary and adding nothing to the efficiency of train operations or to the safety of those employed. Such measures have become laws in twenty states, namely, Arizona, Arkansas, California, Connecticut, Indiana, Maryland, Missouri, Nebraska, Maine, Nevada, New Jersey, New York, North Dakota, Ohio, Oregon, Pennsylvania, South Carolina, Texas, Washington and Wisconsin.

In order to set clearly the facts involved in this movement the Bureau of Railway Economics has recently published in bulletin form the results of an exhaustive investigation into such legislative tendencies, which it has published under the head of "The Arguments For and Against Train Crew Legislation." According to this bulletin, the first efforts to secure train crew legislation date back as far as 1902, but in the earlier years such efforts were almost inevitably defeated in the legislatures where they originated. In fact, in some recent instances, bills of this character have passed both houses of the legislature only to be vetoed by the governor as in the case of the full crew bill passed by the Massachusetts legislature in 1912, but vetoed by Governor Foss. While Governor Sulzer, of New York, within the past year, signed a full crew bill passed by the state legislature, his two immediate predecessors, Governors Hughes and Dix, vetoed similar bills. Governor Cruce, of Oklahoma, and Governor Harman, of Ohio, have also vetoed similar bills on the ground that general legislation requiring the railways to employ additional men on trains was undesirable.

In all these efforts to force the railways to employ additional men in train operations, the Brotherhood of Railway Trainmen has been the chief promoter. While the efforts of this organization have been successful in the states enumerated, a number of other state legislatures have still refused to pass such bills, among which are Colorado, Delaware, Florida, Georgia, Illinois, Iowa, Kansas, Kentucky, Louisiana, Michigan, Minnesota Mississippi, Montana, New Hampshire, New Mexico, North Carolina, South Dakota, Tennessee, Utah, Virginia, West Virginia and Wyoming.

The bulletin points out that in spite of organized labors' demand for additional men on the train crews, train operations, owing to various improvements, do not require nearly the effort or the risk which they did a few years ago. For example, coupling, which was then universally done by hand and proved extremely dangerous, is now cared for by automatic couplers. Hand brakes which were characteristic of the service a few years ago, have been replaced by air brakes.

Digitized by Google

Modern signaling methods and devices have also tended to lessen the work of certain members of the train crews. To quote from the bulletin:

"These improvements in equipment have had a far-reaching effect upon the work of railway trainmen. The engineer of a train, whether passenger or freight, is now its real brakeman and, save under exceptional conditions, sets and releases the brakes from his cab on the engine. The 'brakemen,' so called, seldom have anything to do with the brakes except on detached cars during switching operations. Indeed, the term 'brakeman' is now a misnomer and is being displaced in railway usage by the term 'trainman.' The general substitution of the automatic coupler for the old link and pin has changed the character of the trainman's work in coupling and uncoupling and has very greatly diminished the hazard. Indeed, railway managers claim that, if the trainmen comply with their instructions, the hazard is eliminated entirely. Formerly, when coupling cars, the brakeman had to stand between the cars at the moment of their coming together in order to guide the link into its place. This entailed great risk of having his hand crushed, as well as of being thrown down and run over. Now, any necessary adjustment of the coupler can be made, and ought to be made, before the cars are put in motion to effect the coupling. Formerly, when uncoupling, the brakeman had to stand between the cars to remove the pin. Now, the pin that locks the coupling can be removed by a rod extending to the side of the car. Thus during neither the coupling nor the uncoupling does the trainman need to stand between the cars. These changes apply to both freight and passenger cars. How greatly they have reduced the hazard of coupling and uncoupling cars is indicated by the following table:

CASUALTIES TO TRAINMEN FROM COUPLING ACCIDENTS 1890 AND 1910.

Year.	Total Number of trainmen.	Total killed.	Total injured.	Number killed for each 10,000 trainmen.	Number injured for each 10,000 trainmen.
1890	153,235	265	6,073	17	400
1910	318,632	174	2,826	5	88

"In addition to the changes in their work directly resulting from the introduction of air-brakes and automatic couplers, there have been other modifications in the duties of trainmen which may be briefly noted. In the first place, the train crew as a rule no longer makes up and inspects the train at terminals. Switching crews now make up all trains at all important points of origin and, after they have been inspected by inspectors employed for that purpose, deliver them to the train crew ready for operation. The train crew has no more to do with the preparation for the run than to test the brakes. At the end of the run the train crew has only to deliver a train to the switching crews, which separate the cars for further disposition. It may also be noted that the work and responsibility of freight conductors en route has been lightened by the present practice whereunder a yard clerk furnishes them a statement of the cars in the train, with the respective destinations, from which the conductor checks off each car as it is set out and to which he adds other cars as they are picked up. Formerly, the conductors had to prepare these statements of the cars composing the trains.

"Again, the trainman's duties on passenger trains are less arduous because passenger trains are now almost universally heated with steam or hot water from the engine, and the trainman has only to regulate the degree of heat. The gradual displacement of the oil lamp by gas and electric lighting has relieved the trainman of many former duties.

"It is obvious that an increase in the number of men in a train crew means an increase in the operating expenses and, unless accompanied by a corresponding increase in the traffic per train or in rates, means a decrease in net operating revenues. The railways are reporting to the Special Committee on the Relation of Railway Operation to Legislation careful estimates of the additional expense resulting from state legislation already enacted. At the time this bulletin goes to press, that committee had not received estimates from some of the largest lines. However, the estimates that have been reported up to this time are given in the following table as a partial indication:

ESTIMATES OF ADDITIONAL ANNUAL EXPENSES TO THE RAILWAYS IN CERTAIN STATES, SO FAR AS REPORTED TO OCTOBER 1, 1913, RESULTING FROM TRAIN-CREW LAWS ENACTED BY THOSE STATES.

Arkansas	$179,085
California	66,297
Indiana	244,052
Maine	602
Maryland	96,921
Missouri (a general estimate)	500,000
Nebraska	24,367
New Jersey	381,851
New York	854,016
Ohio	139,592
Oregon (O., R. & N. Co. alone)	47,000
Pennsylvania	1,211,233
Washington	158,020
Total, reported to date	$3,903,042

"Considering the number of railways not represented in these estimates, and the importance of some of them, it is not improbable that the additional annual expense to the railroads in the above-named states on account of the train-crew laws enacted by these states will amount to $6,000,000.

"These estimates apply to the expense to the railroads on account of train-crew laws enacted in only a limited number of states. But the full effect can be seen only from estimates that apply on account of all such laws to all the railways in the United States. Four train-crew bills were introduced in Congress in 1909 and 1910. The Special Committee on the Relation of Railway Operation to Legislation made inquiries early in 1910 of all the railways as to the cost to them of complying with these federal bills, if enacted, as well as the expense they were being put to on account of state legislation then in force in thirteen states. The following table is a summary of the replies received:

Digitized by Google

Estimate of 1910.	Number.	Mileage.	Amount of additional annual cost of compliance with full-crew bill.
Roads replying	166	205,547	$18,328,302.32
Estimated for other roads exclusive of Canadian and Mexican roads	126	23,254	1,953,336.00
Total	292	228,801	$20,281,638.32

"Another bill was introduced in Congress in 1912 which required that on each freight train containing twenty-five or more cars the crew shall consist of at least an engineer, a fireman, a conductor, and three brakemen, 'regardless of any modern equipment of automatic couplers and air-brakes.' This bill made no reference to passenger train crews. As a result of inquiries made of the railways by the Special Committee on Relations of Railway Operation to Legislation, in connection with this proposed federal law, the following compilation was made from the replies received from 143 operating companies:

ESTIMATES OF COST, IN 1912, OF TRAIN-CREW LAWS FURNISHED BY 143 OPERATING COMPANIES OPERATING 195,049 MILES.

Trains affected by state laws then in effect, per annum	*678,661
Additional trains affected by proposed federal law in states then having full-crew law, per annum	468,483
Trains affected by proposed law in states then having no full-crew law, per annum	3,211,056
Total trains affected by state laws and proposed Federal statute, per annum ..	4,358,200
Cost of compliance with state laws then in effect, per annum	*$1,797,589.94
Additional cost of compliance with proposed law in states then having full-crew law, per annum	1,342,237.17
Cost of compliance with proposed law in states then having no full-crew law, per annum	10,255,790.66
Total cost per annum of compliance with state laws and proposed statute	$13,395,617.77

*Does not include states where laws were passed subsequent to 1911.

"This tabulation shows that, according to the estimates of these 143 railways operating approximately 85 per cent of the steam railway mileage of the country, the additional cost to them of complying with the proposed federal bill in states where train-crew legislation is already in operation would amount to $1,342,237.17 per annum, or approximately 75 per cent of the cost of compliance with state laws already in effect. The estimated cost to them of compliance with the proposed federal act in states where there was no train-crew legislation was estimated to be $10,255,790 per annum; the estimated cost to them of compliance with the state laws then in effect was $1,797,589.94; making the total estimated expense of these 143 companies for federal and state legislation to be $13,395,617.

"It should not be overlooked that this expense is only a part of the total increase in operating expenses that has been caused by legislative requirements imposed upon railroad operations. Such legislation includes laws requiring eight-wheel cabooses in place of four-wheel cabooses, laws limiting the hours of service, requiring electric headlights, requiring the installation of improved safety appliances, regulating the stops of passenger trains, the speed of stock and freight trains, requiring the abolition of grade crossings, or the installation of additional watchmen at crossings, requiring double track, and providing for days off at the company's expense. Quite independent of the question of the defensibility of these laws is the fact that they add greatly to the expense of railway operation, which must eventually find expression in higher charges to the public than would otherwise be made.

"However, the fact that such train-crew legislation increases operating expenses is not a conclusive argument against it. The legislation, presumably, is intended to promote the interest of the public, and the question at issue is whether there are benefits directly or indirectly conferred on the public, and, if so, are they commensurate with the expense incurred.

"The official statistics of the Interstate Commerce Commission show that a large proportion of the accidents to trainmen are due to their being struck or run over by engine or car, falling from cars or engines, coming in contact with overhead or lateral obstructions, or that they occurred while getting on or off cars or engines. Of the total casualties in 1912, 50.4 per cent of those that were fatal and 34.1 per cent of those entailing injury were so caused.

"While it may be conceivable that an indirect connection might be shown between some of these accidents and a supposedly insufficient number of employes on the train, such a connection seems remote and cannot be established by any existing information. It does not seem clear that an increase in the number of employes would tend to reduce such accidents as these. Rather might it be assumed that an increase in the number of trainmen would tend to increase the number of such accidents. For example, if a third brakeman on freight trains were required to ride on the top of the train, it is fair to assume that there would be an increase in the number of brakemen killed and injured by falling from cars or coming in contact with lateral or overhead obstructions. An increase in the number of trainmen would not, of course, reduce the casualties resulting from fires, floods, landslides, or explosions.

"This conclusion seems to be well supported: An analysis of the causes of accidents to trainmen indicates little or no possibility that larger crews would reduce the risk of accident to trainmen.

"Turning to train accidents proper, the important causes are collisions and derailments. The Interstate Commerce Commission makes the following classification of the causes of derailments occurring in 1912:

	Number.
Derailments due to defects in roadway, etc.	1,877
Derailments due to defects of equipment ..	3,847
Derailments due to negligence of trainmen, signal men, etc.	423
Derailments due to unforeseen obstructions of track, etc.	412
Derailments due to malicious obstruction of track	75
Derailments due to miscellaneous causes ..	1,581
Total	8,215

Digitized by Google

"Out of the 8,215 derailments reported, only 423, the number attributed to 'negligence of trainmen, signal men, etc.,' can be specifically connected with the train crews. The language used by the Commission does not imply that any of these derailments could be attributed to too few men in train crews. It rather implies that they were due to the 'negligence' of those who were so employed. It is, of course, conceivable that defects in equipment might have been noted and derailments avoided had the crew been larger; but this is an assumption which cannot be sustained by any evidence that has been found.

"As to collisions, the Interstate Commerce Commission said in its annual report for 1912:

"'The most disquieting and perplexing feature of the problem of accident prevention is the large proportion of train accidents caused by dereliction of duty by the employes involved. By far the greatest number of our serious train accidents are due to the failure of some responsible employe to perform an essential duty at a critical time. The seriousness of this problem is indicated by the fact that of the 81 accidents investigated up to September 1, 52, or more than 63 per cent of the whole number investigated, were caused by mistakes on the part of employes. These 52 accidents comprise 48 of the 49 collisions investigated and 4 of the 41 derailments. They caused the death of 248 persons and the injury of 1,309 persons. Of the 48 collisions caused by the errors of employes, 33 occurred on roads operated under the train-order system and 15 occurred under the block system. The most numerous failures were by trainmen or enginemen. These were disobedience of orders, disobedience of signals, failure to keep clear of superior trains, improper flagging, and failure to control speed at dangerous points. Such lapses were responsible for 41 of the accidents investigated.'

"During the ten years, 1902-1912, the Interstate Commerce Commission investigated directly through its own agents 1,431 train accidents, which were responsible for the death of 3,447 persons, or about one third of the total number killed in such accidents during this period, and the injury of 18,908 persons, or about one eighth of the total number injured in such accidents during this period.

"The following tabulation shows the causes to which the Commission attributed these 1,431 train accidents:

CAUSES OF PRINCIPAL TRAIN ACCIDENTS ON RAILWAYS OF UNITED STATES, FISCAL YEARS 1902 TO 1912, INCLUSIVE.

	Number.	
Fault of train crew other than brakemen:		
Disobedience of rules or orders	63	
Misread orders	69	
Ran past signal	66	
Ran past meeting point	36	
Carelessness	95	
Forgetfulness	49	
Asleep	40	
Intoxication	5	
Failure to follow schedule	16	
Excessive speed	137	
Other errors	1	
Total		577
Fault of brakemen:		
Failure to set brakes	40	
Failure to flag	72	
Improper flagging	26	
Other errors	5	
Total		143
Fault of dispatchers, operators, etc.:		
Wrong orders	89	
Failure to deliver orders	67	
Signal incorrectly set	60	
Switch misplaced	59	
Other errors	2	
Total		277
Fault of other employes		18
Mechanical defects:		
Defective or weakened track	59	
Defective or weakened equipment	96	
Failure of air-brakes	30	
Failure of block signals	4	
Total		189
Parting of trains		11
Hostile weather conditions		68
Malicious interference with track or equipment		41
Miscellaneous causes		35
Causes uncertain or unknown		72
Total		1,431

"It is the unanimous opinion of railway operating officers that an increase in the number of men normally employed on trains will tend to increase the number of accidents not only to individual employes, but to the trains themselves. It will either result in a dangerous division of responsibility or else in an idle and unnecessary man becoming a hindrance to other employes in the performance of their duties. Replies received in 1909 by the Special Committee on the Relation of Railway Legislation to Operation from railways operating in states where train-crew legislation had been passed were unanimous in expressing the view that no duties were performed by the extra man on a train that could not be performed by the other employes. It was, moreover, the unanimous opinion that the legislation did not and would not increase safety, while many expressed the opinion that it was bound to have the opposite effect.

"There is another side to this question of the effect of full train-crew laws on safety. If it be admitted that train-crew legislation is unnecessary, it must then be granted that such legislation not only will not promote safety, but may by reason of its expense be an actaul obstruction in the way of the development of greater safety of the railways of the country. The Interstate Commerce Commission has frequently called attention to the need for physical improvements. In its annual report for 1912 it directs attention to conditions of track and equipment that lead to derailments, and recommends the universal installation of the block system as a means of reducing collisions. The improvement of track and equipment and the installation of block-signal systems and other physical improvements can be made only by the investment of a large amount of capital. As

Digitized by Google

has been shown, the railways estimate that train-crew legislation applying throughout the country would increase railway expenses to the extent of from $13,000,000 to $20,000,000 per year. The former amount is the annual interest at 5 per cent on $260,000,000; the latter on $400,000,000. It has been estimated by the Special Committee on the Relation of Railway Operation to Legislation that for $260,000,000 block-signal systems could be installed on all railway mileage of the United States not now so equipped—in other words, train-crew legislation would cost the railroads at least as much as the universal installation of the block-signal system.

"Railway officers contend that net earnings are insufficient even now to enable them to make these needed physical improvements. On this point the Block Signal and Train Control Board created by Congress to investigate appliances for the promotion of safety of railroad operation, in its final report to the Interstate Commerce Commission, on June 29, 1912, said:

"'In discussing this subject it may be assumed at the outset that railroad officers and employes are as anxious to do everything in their power to promote safety as the public is to have safeguards provided, and that railroad officials and employes are not immune to the horrors of a terrible wreck. If all think alike and have the same desire, why are not better safeguards provided? The general answer for most railroads is the expense involved. Money is not available with which to provide and install the apparatus. It is needed elsewhere.'"

The Valuation of Railroads

By GRIDLEY BEDE.

A BEAM of light traveling at lightning speed would exhaust the lives of many generations before it would reach a certain remote star. From our own little limited scope of life such a journey seems everlasting.

A similar journey, interminable, indefinable and almost unimaginable is set before the Interstate Commerce Commission by the Act of March 1, 1913, ordering it to make a "valuation of the physical property of common carriers," the railroads.

Until the task is carefully considered and the law examined, this sounds almost as simple as starting a flash to fly across the spaces; for surely "physical property" means such things as have weight and shape and size, and therefore a list of it all could be quickly prepared.

On the contrary, it will take years to complete Ten million dollars is estimated as the cost, and when it is done, then instantly will the results change, and changes in the results will continue as long as "common carriers" continue to operate.

To aid in making a seemingly simple task measure up correctly in the mind of the man on the street, some few details of the act must be understood. The Interstate Commerce Commission has this to do:

1. It shall make an inventory of the property of every common carrier in detail.

2. It shall ascertain the value of all the property owned or used by any common carrier.

3. It shall report (a) the original cost to date of all such property; (b) the cost of reproduction, less depreciation.

4. It shall report separately other values and elements of value of such property. (This is the indefinable part of its task.)

5. It shall report (a) the original cost of all lands, rights of way, and terminals; (b) the present value of all such; (c) the present estimated and the past cost of condemnation.

6. It shall report on (a) the history and organization of every railroad ever operated in the United States, whether now part of a system or independent; (b) on the stocks, bonds and other securities, increased or decreased since the beginning of our railroads; (c) on all banking, syndicating, and other financial arrangements involved in marketing stocks, bonds, etc.; (d) on the net and gross earning, and also the expenditures of all railroads.

7. It shall report (a) all gifts of lands or aid of any kind to railroads by the Government of the United States, by any state, county, municipality, individual, etc.; (b) the price realized on sales of such gifts or aid; (c) all concessions made in return for such gifts or aid.

8. It shall show the value of every common carrier as a whole, and then in detail, within each state or territory it enters or traverses.

9. It shall report to Congress at the beginning of each regular session until the task is done.

10. It shall thereafter report every change in values of every kind. (This is the interminable part of its task.)

When it is through, the valuation of any railroad shall be a "tentative" valuation against which the "common carrier" can protest. When this is ended, then the final value (which is subject to change indefinitely and forever and therefore never "final"), "shall be prima facie evidence of the value of the property."

The reader needs only a few suggestions to make him understand that under item No. 4 we shall never come to agreement; for the cost of a railroad and the value of a railroad are two utterly different things. A perfect mile of railroad might be constructed in the Mojave desert. Its cost would be great, but its value nothing; for it would do nothing for the good of anybody. Some very imperfect miles of road exist here and there but their value is immense; for they possibly give value to every other mile as far as the Pacific Coast. They are essential links. Some holiday resort railroads fluctuate in value just as the thermometer goes up or down. They cost for construction, but their value exists chiefly in the summer time.

Note this variation from all the above. The cost of a railroad between two great cities is less if it can make a bee-line or avoid tunnels; but the less it costs and the shorter the distance it runs, the greater is its value.

These illustrations give an idea of what a task is "intangible" valuation.

Who shall decide whether Iowa railroads have gone down in value and how much by the decline in population in the last decade?

Digitized by Google

Michigan railroads were stated by Michigan officials to have $35,814,043 worth of this foggy something belonging to them in 1900; but Wisconsin, on the other hand, credits no intangible value at all to its railroads.

The state of Washington credited the Northern Pacific with one per cent intangible value above cost of reproduction of the railroad, but New Jersey adds 20 per cent or $75,841,600 and then deducts 20 per cent for depreciation (which is an absolutely unhaltable process) and so there you are; the value of New Jersey railroads is just what it cost to bring them into existence.

Minnesota sees no "intangible" values; neither did Massachusetts when it was trying to get at the value of the New Haven road.

Now let us see how the complications multiply beyond all the above. The value at which a railroad should be marked if in the market for purchase is its earning power; just as the value of a horse lies in what it can earn and not in the direction it may be headed.

But two lines of equal cost would not necessarily have equal value, for an old "going" line has more value than a new one just developing its territory.

Then into the puzzle comes the value of strategic position, for instance, the stretch of rails between the Harlem Bridge and the Grand Central Depot, over which the New Haven must pass. The privilege of passing over this strategic stretch is figured away up in the millions.

Piling a little more on the problem: The depreciation question has the railroads themselves in doubt, and how can a remote commission decide this for 40 per cent of all the railroad trackage of the world? Some railroads wear out quicker than others. Ties are always decaying. Kansas ties are only valued at 56 per cent of their cost. The far-South tie in its moisture will not live as long as the Arizona tie in its dryness, but on the other hand, Southern tracks will not have to be constantly moved or lifted to keep up with the encroaching sands. Every mortal device grows old; some things on a railroad age out and some wear out, but when they are out they are out and unless replaced is no railroad.

Depreciation must everlastingly be emphasized, for it is the one factor that is always active; and efficiency consists in supplying material for it to gnaw away, but whether it is 20 per cent or 10 per cent or 5 per cent it is only possible to tell after replacement; for one year may wear hard and another lightly; for instance, the Baltimore and Ohio had $4,000,000 worth of equipment loss in the floods of last spring.

Now going one step farther back—to construction. It is self-evident that such a road as the Union Pacific, from Omaha westward across Nebraska, was little more than a matter of laying ties on a gradual rise; but the way across the Sierra Mountains in California was one to test men's every device and capacity. All these differences this great task involves.

A thousand other complications could be ranged in rows and then not exhaust the list. But passing back to the very first item in railroad building—the right of way—it must be realized that in many cases the right of way acreage costs two and one fourth to two and one half times as much as the value of the land it touches. But to duplicate now at two and one fourth times present values would be prohibitive, and yet such possibilities of reproduction have to be reported on; which is reporting on something purely imaginative and quite useless except for technical argument and increasing technical employment.

The last question should really be first: What is this valuation for? It is to find a supposed scientific basis for railroad rates—both passenger and freight. This cannot be done by the means proposed, for this contradiction is visible—if a passenger rate is rightly low in a crowded territory where prosperity flourishes, then a rate ought to be high where the population is sparse and poor and journeys necessarily long. Yet from the pocketbook point of view the crowded region could stand high rates better than the thin region.

When the enormous task of the Interstate Commerce Commission approaches completion and the Federal Government can prevail over all the jangling, confusing railroad laws of all the states, then it seems possible to foretell a general advance instead of a decline in rates, both passenger and freight; and for this reason: railroads must come to the point of providing out of earnings a sinking fund for reproduction and thus avoid everlasting dependence on the money market for bonds piled on bonds and obligations plastered on every decaying asset. The unwise agitation against railroads on one hand and the former indefensible independence of public service on the part of railroads on the other hand has reached its limit in this scheme. In the years that will elapse before the task approaches is first form of completion, the common sense of the railroad magnates must work out the idea of a sinking or replacement fund for property and "amortization" for the bonds; for indefinite and tension of bonded indebtedness is impossible.

The Nobility of Good Workmanship

IN a recent address delivered to apprentice boys at the Frisco's shops at Springfield, Mo., George M. Bassford, chief engineer of the railroad department of Joseph T. Ryerson and Son has the following to say, in part, regarding good workmanship:

"Everybody depends upon good workmanship. Good workmanship is a part of nobility. Poor workmanship is evidence of moral degeneracy. There is nothing the industrial world needs as much as it needs good workmen, and yet it is difficult to find them. Far too many good men must be employed to discover and correct the defective work of the inefficient and the unskilled. The greatest curse of industry to-day is its dead load of those who lack the desire to take pains with the work of their hands and brains. A sloven could become a genius if he would take pains with his work. The safety of thousands of steamers and trains to-day lies not alone in good workmanship, but also in the consistent elimination of poor workmanship. This should not be true and

Digitized by Google

would not if we had enough of such apprenticeships as this and if enough of our railroads had officials inspired as are those of the 'Frisco' to place before their recruits the opportunities which you enjoy.

"You are the most fortunate boys in the country. You and a few others on railroads providing up-to-date apprenticeship. Do you appreciate this fact? See what is being done for you? You are ingrates if you do not sit up nights to show your officers that they are wise in spending stockholders' money so lavishly to help you. What are you doing about it to indicate to them that the scheme is worth while and that you are worth so much of their thought and trouble? It costs the Government some money to train a high officer in the navy. Think for a moment of how Perry, Farragut, Dewey and others proved that it was worth while to train men. It is necessary to train naval men, and everybody understands this fact. I have for years thought it even more important to train apprentices than naval men, but too few people have been broad-minded and far-sighted enough to provide apprentice opportunities. You ought to be thankful that your lot has fallen here under such leading officials as good fortune and good judgment has brought to the Frisco. If you do your part you will some day see and understand this if, perhaps, you do not understand and appreciate it already.

"Now for your own sakes and for the satisfaction that it will bring you, I implore you to make a job of your side of this bargain. You are receiving a liberal education, such as no school or college can give you, and are not only paid for getting it, but are being provided for in this organization while obtaining it and after it is attained. The slang phrase, 'go to it,' is the word for you. Then remember what Franklin said, 'Plough deep while sluggards sleep,' and the immortal words of Longfellow:

"'The heights by great men reached and kept,
Were not attained by sudden flight;
But they, while their companions slept,
Were toiling upwards in the night.'

"Franklin was the son of a poor man. He learned the printer's trade and in a long life of extraordinary usefulness he proved the wisdom of another of his undying lines, 'He that hath a trade, hath an estate.' Bear this in mind when by mere temporary increase of wages you may be tempted to quit for a better paying job before your apprenticeship is completed.

"Speaking of sons, let us consider three kinds of sons.

"Sons of Rich Men—These have school advantages, also college and automobiles, boats, with lots of time to use them. Do not envy these. With almost no exceptions they have no real pleasures. They give the world nothing. They are helpless hangers-on, parasites, living off the lives and work of others. They are tired of everything and the world tires of them. It is difficult to be charitable toward them.

"Sons of Comfortable Men—These really have some chance and they form a respectable class. They may go to college, and if they do, they go with a purpose. They work. They take important places and feel the responsibilities of life. They are usually worthy citizens.

"Sons of Workingmen—These are sons of the class that has made this glorious country, the class that has done and will do the big deeds of the world, the class that makes everything we need, the class that makes possible the greatest of all the facilities we need—transportation. This is the class that knows the best happiness of life, the pleasure of doing, and doing well, a necessary piece of work for the welfare of mankind—for work alone is noble. I congratulate you upon being of this class, the class that the world cannot get along without and the class we are most proud of—real Americans.

"It is not conceivable that there is any higher attainment than to fulfill this specification:

"First—Be a man.

"Second—Be a workman.

"Third—Be a good workman.

"Fourth—Be an intelligent one.

"Fifth—Climb as high as you are fitted to climb.

"Sixth—By good work fit yourself for promotion, and no force can keep you down, always remembering that advancement may as well mean improvement in one's present work as in official promotion.

"You will hear men talk of the good ol dtimes—past—never to come again. You will hear them say there is no chance for boys to-day. Do not forget that there is something more permanent even than the mountain—progressive improvement. These times are better than any that are past. They present opportunities better and more promising than ever were presented before—if we know how to use them.

"For some years I have tried to state in a few words the object of modern apprenticeship as I understand it. This seems to represent the idea as well as I can state it now—

"To recruit the ranks of mechanics with efficient, capable, thoughtful young men, prepared to establish themselves and contribute to the success and happiness of mankind. To produce competent workmen who know what they are doing, why they are doing it, and who appreciates the place of their product in a completed whole. To supply capable, constructive, self-reliant citizens who will understand that good workmanship produced without waste is of itself and for its own sake sufficient inspiration for the best endeavors of which a man is capable.

"The purpose is not to train leaders, but followers; not presidents, but workmen, who will appreciate and profit by their advantages and will keenly feel the responsibility of assisting in the training of others. We need to build up the organization with skilled thinking workmen, who recognize their obligations to their fellow-workmen, their employers, the world and themselves.

"I may be talking to the future president of this road or of the United States. Some one has said that of the forty-seven railroads having offices in New York City, forty-six have presidents who have risen from the ranks. These men by reason of their knowledge, ability and forcefulness, have risen to the leadership of vast properties. It is, therefore, stated that any employe of a large organization may become its official head. It is also said to be possible for any native-born citizen of the United States to become president of the nation. This possibility for advancement in a country devoid of hereditary class distinction is both a blessing and a menace. It is a blessing as a democratic principle and a menace as a cause of awakening ambitions unsupported by ability and preparatory achievement. Men become presidents after long preparations as progressive-

Digitized by Google

ly successful subordinates. They advance because they are good workmen or they do not advance at all. If we make it our business to be good workmen and find and fill the place for which we are fitted, we shall have no complaint to make of an ungrateful world.

"It is unfortunate that anyone is saying that apprenticeship is necessary in order to supply foremen, superintendents and higher officials. Considered from the standpoint of numbers alone, this is a mistake. Remember that the best possible officers can do little with multitudes of incompetent workmen. Be a good workman and let the leadership come to those who can command it.

"Climb—yes, as high as you can, but remember, the safest climbers who continue to rise are those who step on every round of the ladder as they go. Those who climb and help others up have support for their positions, whereas those who climb alone or try to pull others down stand alone in great danger of a fall."

Railway Borrowing Since 1900

By SLASON THOMPSON.
Director of Bureau of Railway News and Statistics.

NET funded debt on railways of the United States increased 32.3 per cent between 1904 and 1911. Simultaneously interest paid on funded debt expanded 37.8 per cent. That portion of the debt paying three to four per cent interest was cut to less than half, falling 56.6 per cent. So figures based on par value and nominal interest rates well may be too conservative.

Such considerations as this are essential in contemplating the analysis of railway funded debt (Table 1) compiled from reports of the Interstate Commerce Commission:

TABLE I.
COMPARATIVE SUMMARY OF PERCENTAGES, SHOWING PORTION OF TOTAL RAILWAY FUNDED DEBT PAYING STATED INTEREST RATES, 1900-1911

Per Cent Paid.....	Noth-ing	Under 2	2 to 3	3 to 4	4 to 5	5 to 6	6 to 7	7 to 8	8 to 9	9 to 10	10 and Above
1900	6.78	4.21	4.84	22.95	32.82	15.69	8.68	3.68	.18	.06	.11

(1) Less than .01 per cent.

cent; bonds paying four to five per cent almost trebled, increasing 174.8 per cent, and five to six per cent bonds more than doubled, advancing 134.1 per cent.

Such a readjustment, traceable in figures of the Interstate Commerce Commission, reflects strikingly that steady advance in cost of capital, as one item of the cost of living, which today has left the railways with a heavier burden of financing than they have ever before borne. To approximate it one must revert to the early 90's, preceding the great era of receiverships.

What exactly represents the excess demanded in fixed charges to carry a given portion of the railroad funded debt as compared with ten years ago is impossible to determine. Accessible figures presenting par value of bonds and nominal interest rates ignore the all-important item of discount. What a borrower pays for his money, as for any other commodity, depends as much on what is received as on what is given. Increase of discount offered as allurement to capital, by contracting the money actually reaching the treasury, heightens necessarily the real cost to the borrower. Yet while this ignoring of actual prices received for bonds making up the railway funded debt thus creates a serious error, its effect is sure. In a rising money market, or conversely a falling bond market, such as that since 1900, disregard of increasing discounts must understate the real advance in

Two features stand out in this comparison: First, the decline in bonds paying less than four per cent; second, the corresponding advance in those paying four to five and five to six per cent. This growth between four and six per cent has taken place almost wholly at the expense of bonds paying under four per cent. Furthermore, the bulk of this shift has occurred since 1904, shown to be the turning point marking inception of the present rise in capital costs. In 1904, bonds paying two to three per cent played only a slightly smaller part than in 1900. Those paying three to four reached their apex at 38.45 per cent. Those paying four to five were near the lowest and those paying five to six were at the lowest for the entire period.

From 1904, however, there is a steady climb. By 1911 the two to three per cent bond has almost disappeared and the three to four per cents constitute only one-ninth of the total, where in 1904 they had been over one-third. The four to fives, beginning an almost unbroken rise, climb by 1911 to 60.08 per cent of the entire railway funded debt! In seven years five to six per cent money in railways has climbed from $804,000,000 to $1,883,000,000; four to five per cent money has climbed from $2,146,000,000 to $5,897,000,000 and three to four per cent money has fallen from $2,576,000,000 to $1,117,000,000!

Striking as is this showing, it does not ade-

Digitized by Google

quately portray the change. As bonds generally are issued for long periods, the railways to-day are paying interest on debt incurred, in large part, during more propitious years, an advantage which operates to offset largely the higher rates paid on newer money and to hold down the average, as analyzed above. To gain an idea of what has taken place in new capital alone, a compilation has been made of listings of railway bonds on the New York Stock Exchange from 1900 to 1912, analyzing these by rate of interest. This is given below in Table II.

TABLE II.

COMPARATIVE ANALYSIS OF BONDS LISTED ON N. Y. STOCK EXCHANGE BY RATE OF INTEREST BORNE. (000 OMITTED)

	3s	3½s	4s	% at 4 or Under	4½s	5s	6s	% over 4 %	Total	Short Term Notes*

*Notes not included in compilation of listings. Mostly 5 and 6% interest borne.
‡Includes $12,927,500 at 7%. †Includes $20,000,000 at 4¼%.

Interwoven with these figures may be read the serial story of railway fortune and adversity. Most striking at first glance is the conspicuous absence of three and 3½ per cent money since 1909. Of equal significance is the fitful rise of bonds carrying above four per cent, from 13.88 per cent of the total in 1900 to 65.50 per cent in 1912. Here, too, the turning point is seen to be the years just preceding that rise in money which culminated in the financial disturbance of 1907.

Equally interesting is the accurate reflection of a constant striving after necessary capital to finance improvements and betterments demanded by growing traffic; the prompt responses to favorable money conditions; the repeated hauling in of sails under lowering tempests.

Listing of bonds in 1900 reflected only partially the gradual revival of confidence among investors. They had been exceeded in several previous years, and securities for new extensions and improvements were few because of the pre-election depression. Both 1900 and 1901 were years of refunding former temporary financing, but in the later year, with the advent of the great era of consolidations, listing reached the largest aggregate in the history of the exchange. Railroad bonds alone totalled $667,000,000. Heavy listings continued into 1902, largely for control of other properties, but there was also a free use of bonds for improvements and additions, furthered by an easing of money in early 1903.

A financial depression in the latter part of that year caused a slump to $271,000,000 in bond listings, and railways again resorted to temporary financing to cover immediate needs. So it was that 1904 again was a year of refunding short term notes, the Lake Shore alone issuing $40,000,000 to replace notes sold in 1903. The following year, 1905, was another oasis in the desert. Prompt to seize the advantage of cheaper money, large issues were put out on a wave of improvements and extensions to road, and the total, at $538,000,000, was exceeded only by the record year 1901.

With sails thus unfurled, many roads in 1906 were on the point of selling large issues for needed expansion of facilities, when development of a strain in the money market rendered it impossible to float more than a small part, and the voyage again halted. Despite extraordinary growth in general business and increasing dividends which made 1906 a stockholder's year, bond listings, at $306,000,000 were below either of the two previous years.

New issues for railroad extensions, additions and betterments in 1907 would have exceeded any previous year in history had sailing been favorable. Acute disturbance of confidence sent money soaring in the closing months rates, touching sixteen per cent for 90-day loans in November, became absolutely prohibitive. Under the storm clouds the sails were tightly reefed. Bond listings fell to the bottom for the period under review; temporary financing through short term notes vaulted and then fell flat, in the second half year even these high interest bearing issues being cut off.

After-effects of this disastrous year were seen in 1908. Though temporary financing continued for a time, gradual restoration of confidence and relaxing rates were bound to encourage numerous loans which should have appeared earlier. So 1908 again was largely a year of providing previous financing. Hardly a short term note was seen in the second half year, but bond listings jumped to $506,000,000 against $268,000,000 in 1907, the largest, excepting one year, since 1901. Notable as had been recent years for new railway construction, financed before the depression, much of the 1908 listings was for further development of facilities.

Remarkable ease of flotations in the late months continued, and the listings for 1909 were a striking proof of the credit revival which again carried the railways under bulging sails. Their bonds at $770,000,000, touched the highest mark ever recorded. Rail securities embodied the bulk of record listings for all classes of stocks and bonds. All capital transactions that restored confidence could inspire contributed their share: Money was raised for new undertakings, for additions, for funding floating debt, for refunding maturing bonds, for retirement of short term notes, for exchange of convertible

Digitized by Google

bonds into stock, and for completion of consolidations.

But after this the deluge. Under slackening commercial activity new bond listings again shrank, in 1910 the railway total not only falling $336,000,000 under 1909, but under 1908, 1905 and 1901 as well. Some needs were financed early, while money still was favorable, by sale of new stock; but bonds were at the foot of a hard-scrabble. The 1911 total at $298,000,000 was far below the two previous years, though early issues for improvements, additions and extensions were on a liberal scale. Not only was the total lowest with two exceptions since 1900, but New Capital included was only 70 per cent of the total for 1910, and less than 60 per cent of 1909! Disturbed confidence again reduced permanent issues of all kinds; short term notes again became conspicuous.

Thus is ushered in 1912, most deplorable for railway credit of the thirteen-year period. Despite remarkable general trade, bonds of all classes, though above 1911, were far below 1910 and 1909. Railway bonds, unlike other classes, failed to gain even over 1911. Shrinking $90,000,000 they reached the lowest ebb in the entire thirteen years, $58,000,000 under even the disastrous panic year 1907! And of this total 75 per cent was issued by six roads! Whence the discrimination? Falling rates, harassing legislation, labor demands must be considered by investors!

Short term notes, the putting off until to-morrow of what cannot be done to-day, are the danger signals of railway borrowing. Only in recent years has the putting off been persistent enough to warrant detailed recording, yet from $265,000,000 and $274,000,000 in 1907 and 1908, after a fall to $53,000,000 in the happy year 1909, they have climbed to $124,000,000 in 1910; to $255,000,000 in 1911; to $279,000,000 in 1912, the largest volume of makeshift financing on record!

That is not all. In 1912 this stop-gap financing, paying mostly five and six per cent, exceeded by $70,000,000 the actual listings of railroad bonds!

Add these $279,000,000 of notes to bonds, and not 65 per cent but almost 85 per cent of railway borrowing in 1912 was on poorer than a four per cent credit basis!

Temporary financing entails refunding, whether or no there dawns the hoped-for day of better money markets. In the past, successive refunding eras, it is seen, have been on ever higher interest levels.

Railways of the United States need nearly $1,500,000,000 annually to cope efficiently with traffic which grows eight per cent a year. In thirteen years, five have been characterized by liberal bond issues for improvement and extension!

In 1912, with 11,000 more miles of line, our carriers listed $561,000,000 fewer bonds than in 1909. With 20,000 more miles of line, they listed $58,000,000 fewer bonds than in the panic year 1907!

Railroad stocks, bonds and notes marketed in 1912 for New Capital, at $500,000,000, fell almost $1,000,000,000 below requirements. Their stocks and bonds were nineteen per cent of the total of all classes marketed, against 62 per cent ten years ago! For the money that investors are free to deny an industry marked for restriction, the railroad borrower must pay, like others, $50,000 or $60,000 yearly on the million, where $40,000 would suffice ten years ago.

Highest interest rates; lowest bond offerings; highest temporary borrowing since inception of the new century. A billion less capital than needed for upkeep and growth after five years of liberality in thirteen! Not only are sails furled; the ship is anchored. Yet a nation's prosperity rests on the efficiency of its commerce!

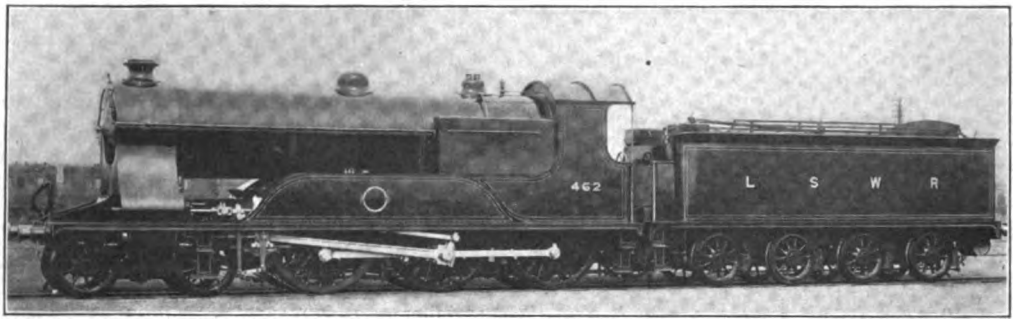
Locomotive Problems in Great Britain

(From our London Correspondent.)

A WIDESPREAD discussion has resulted from the recent serious Aisgill collision up in the Northwest of England. It may be remembered by readers of this journal that the first of two trains stopped from want of steam on a long gradient whilst the second train ran past the signals that were against it and so crashed into its predecessor. It turns out that the driver of the second train failed to observe the signals owing to the fact that all his attention was required just then going round his engine for lubricating purposes and other work connected with the running of the locomotive.

Engines rarely fail for want of steam in hauling modern train loads and the railway mechanical engineer has attacked this and other problems with eagerness and success. As a writer here points out, changes in the type of locomotive employed for modern train working have been slow and cannot be regarded in any sense as revolutionary. There has been a gradual increase in size, and the evaporative capacity has been raised by putting more weight into the boiler. That is a logical development, as although many interdependent factors are involved an essential condition of the modern locomotive is that the steam supply shall be sufficient to meet all possible conditions and be capable of hauling the train even when the coal supplied is of somewhat inferior quality. Stated in this bald way the task of the locomotive engineer may not appear to be an exceedingly difficult one. But that would be a wrong impression, for account has to be taken of many things, of which boiler capacity, cylinder dimensions, adhesive weight, and wheel base problems, are among the more important of the mechanical questions. Strict regard has also to be paid to the economic factors which may be broadly summarized as increased hauling capacity with a minimum increase in first cost, a proportionate decrease in fuel consumption, and an actual decrease in maintenance charges. Nor is this quite all. The civil as well as the mechanical engineering aspect has to be taken into account. The question of the permissible weight is dependent upon the character of the permanent way. Much

Digitized by Google



NEWEST MODEL OF FOUR CYLINDER EXPRESS ENGINE
FOR THE LONDON AND SOUTHWESTERN RAILWAY, ENGLAND.

has been done during the past few years in strengthening main line tracks, in the substitution of heavier for lighter rails and in bridge reconstruction to permit the running of heavier loads upon the roadbeds. The permanent way engineer must be consulted and in modern railway practice the load upon one axle must be limited to about 20 tons. These are the broad features of the problem presented to the locomotive designer, and as in other fields of engineering, the design adopted is in the nature of a compromise.

In the past the demand for additional power has been largely met by the development of boiler dimensions, and but little more can be accomplished in that direction. It was this tendency which brought the Atlantic type of locomotive into existence, but that is now being largely superseded by the 4-6-0 design which not only enables a longer boiler to be fitted, but owing to the difference in the coupled wheel arrangement gives a better distribution of the load and meets the conditions laid down by the permanent way engineer. The conversion of Atlantics into 4-6-0 locomotives is steadily proceeding, and many companies are building for their passenger services a considerable number of these engines, in weights up to 80 tons (one ton equals 2240 pounds) or considerably over 100 tons for engine and tender. For big tank engines the 4-4-2 design has been developed to do the work of the 4-4-0 class.

The limits of size in boilers having been approached, attention is now being concentrated on other points. There is no doubt that much can be accomplished by a careful consideration of the conditions to be met and by limiting the locomotive when built to the class of service for which it was originally designed. That is the explanation of the survival on some British main line routes of the compound locomotive.

In a broad sense it may be stated that boiler design in Great Britain has become standardized, locomotive engineers having generally adopted the multi-tubular type with the rectangular firebox. Many experiments have, however, been made wth fireboxes of different types, an instance being the long series of test runs carried out on the London and North Western Railway with deep and shallow fires to determine the question from the point of view of coal consumption, the results pointing to the advantage possessed by that type. It must be admitted, too, that satisfactory experience of various designs, usually of the round-roof type, has been gained on the London and South-Western, the North-Eastern, and other railways. The Wootten wide type of firebox is threatened by the growing popularity of the 4-6-0 locomotive, which restricts width, and its future largely depends upon the adoption of the Pacific type of locomotive, which is regarded as unlikely. While no hard-and-fast lines can be laid down, the Belpaire firebox, with its large heating surface and comparatively low maintenance costs, has won the favor of a majority of locomotive builders.

The most notable development of the past ten years has been the adoption in railway practice of superheating. Its advantages are now so generally admitted that there is no need to argue the case. Ample comparative evidence is available of the coal and water consumption of superheated and non-superheated engines. The essential point to note in regard to superheating is not that of economy only; it is rather that this practice is equivalent to enlarging the boiler and forming a reserve of power which, as experience has frequently shown, facilitates time-keeping with modern heavy train loads. Quite recently the ability of superheated engines to haul loads exceeding 400 tons over heavy roads has been demonstrated. The superheater is now being fitted to a large number of different types of passenger and goods locomotives and its employment is likely to become standard practice. Opinions differ as to relative costs of maintenance of locomotives using superheated steam and those employing saturated steam, but a point in favor of the superheated engine from the standpoint of maintenance is the possibility of employing lower steam pressures.

The advantages of feed-water heating are not yet generally admitted although the object sought, that of getting a part of the boiler work done before the water passes the clack valve, is an obvious economy. Feed-water heating is accomplished by making use either of the exhaust steam or of the heat of the waste gases passing up the chimney, or of both in series. On Egyptian railways feed-water heating has resulted in an economy in coal consumption of 20 per cent. English railway engineers are by no means agreed on the subject, but experiments on the Brighton Railway have shown an economy from feed-water heating of 15 per cent. Reference should also be made to the attention now being given to water softening, with the object of adding to the efficiency of the boiler.

An intimate relation exists between the size of the boiler and the cylinder dimensions, and these are again partly dependent upon adhesive weight. Here it is difficult to fix practice. The use of three or four high-pressure cylinders is becoming common. An advantage of the four-cylinder engine is that there is a better distribution of the thrust. Up to a certain point the thrust of two

Digitized by Google

cylinders can be employed without risk, but beyond that point the friction renders it necessary to increase the size of the bearings considerably. It is preferable, therefore, when that point is reached to employ four cylinders, and it is believed that the extra cost and complication are justified by results. At the same time it is not a subject on which to be dogmatic. The latest development is the application to a North-Eastern Railway 4-6-0 locomotive of the Stumpf cylinder arrangement on the uniflow principle. The notable fact in connection with valve gear is the advance in favor of the Walschaert type.

With the improvements which have been made in the lubrication system it should scarcely ever be necessary for the driver of an express train to leave the footplate while the engine is in motion. As a normal practice it may be considered obsolete. Mechanical lubrication is now largely employed for the piston, cylinders, and valves, and oil cups which will hold sufficient for a fairly long run are generally fitted to express passenger engines. In addition to mechanical and sight-feed lubrication there is a tendency to lighten the work of the driver in other ways in order that he may be left free to observe signals and to run his train to schedule time. The cab of the modern express locomotive—of which the Great Eastern may be selected as an excellent type—is large and well protected, and in Great Eastern design has lifting side windows. In such a cab the driver has at his disposal a variety of accessory devices which should make it unnecessary, except in exceptional circumstances, for him to leave his position. If the responsibility of the driver has increased with the increase in size of the locomotive, the speed demanded, and the load to be hauled, the locomotive designer has in various ways made the work easier for the engine crew.

In what is written above attention has been given only to a few of the main points. The question of adhesive weights is an important one, and in this respect the 4-6-0 type of locomotive has an advantage over the 4-4-2. It is sound practice to arrange that the adhesive power shall be in excess of the tractive power. A feature in the high-powered modern express locomotive as compared with its predecessors is the better average speed which can be maintained with heavy loads. In place of dropping back to a speed of 30 to 35 miles an hour on heavy inclines and restoring the balance by a speed of 80 miles on falling gradients a 4-6-0 superheated locomotive will keep the speed range within much narrower limits—say, 45 to 70—and still keep better time.

What the next step in the chain of development may be it is difficult to predict. The limit in size of the steam locomotive under present conditions has been nearly reached; the Great Western Company have not repeated the experiment made in the construction of the Great Bear. A satisfactory feature is the tendency, first revealed when Bowen Cooke became chief mechanical engineer of the London anl North-Western Railway, for the locomotive designers of British railways to undertake joint experimental work and to carry out comparative tests with different types of locomotives with the object of determining the type best suited for special services.

The Southern Pacific's School of Railroading

SEVEN young men from the ranks of railway employes of the Southern Pacific have recently been awarded scholarships in the school of practical railroading which that company maintains. The Southern Pacific's school of railroading, under Norman Collyer, is unique among educational institutions. Officers of the company conduct the course and the students are scattered from Portland to El Paso. There are no paid instructors and no tuition fees. The students are under salary. None but company employes are eligible and no married men are appointed, in which respect there is a resemblance to the schools at Annapolis and West Point. The students are between the ages of twenty-one and thirty and are chosen for grit, ambition, intelligence and efficiency that they have shown in their previous work.

The Southern Pacific course covers a period of forty-two months, approximately that of a college curriculum. The beginner starts at a medium-sized station, where he serves six months as warehouseman, baggageman and clerk, performing the actual work as any other employe. He is then transferred to another division to spend three months in track work. After he has learned to handle a spike maul and raise low joints, he is moved to the Flood Building and puts in three months with the superintendent of transportation. Next comes three months in the shops, then the same period in train service; then three months in the accounting department; and finally three months in the tariff bureau of the traffic department, making two years in all.

If he has met the rigid requirements of the course, the student is now ready to choose whether he will follow the operating, the traffic, or the accounting branch of the railroad business. In whichever line he elects, he is given special opportunity for experience and advancement.

If the student chooses the operating department, he returns to the shops and roundhouses for a further polishing along mechanical lines; he puts in two months in the stores department and two months in the signal engineeer's office; he acquires greater efficiency in maintenance of way; later he spends two months in the general manager's office, where he gets in touch with the organization as a whole; and finally he is given a five months' finishing with yardmasters, dispatchers and trainmasters of a busy division. At the end of this time, he is adjudged either fit material for a minor official position or not worth saving.

Similarly in the traffic department, a student is given special work in a ticket office, in the solicitation of freight, and as assistant to a freight and passenger agent at an outlying point, where he will be directly in contact with patrons of the company and become versed in the art of selling transportation.

If he chooses the auditing department, his last eighteen months are spent entirely in the general office tracing the intricate threads of the accounts.

Since appointments to the student course are

Digitized by Google

made only from the ranks of employes, it frequently happens that the student has had sound and practical experience in one or more of the departments assigned. In this case, he is given advanced credit and is not required to duplicate his work unnecessarily, since the company is frankly looking forward to his completing his course and sharing the burden of official responsibility.

The salaries are prescribed according to a schedule and vary from $75 to $100 per month. The majority of the students have surrendered positions paying more than $75 per month in order to take advantage of the unusual opportunities offered by the course.

Panama Railroad Cross Ties

THE chief engineer of the Panama Railroad has prepared a report of the use and life of hardwood ties laid in the roadbed of the line since 1878, and specifications under which they have been purchased since the United States assumed control of the road. The report, in part, is as follows:

The original track of the Panama Railroad, as it existed in 1885, before being disturbed in any way by the Canal operations, was laid with small hardwood ties obtained on the Isthmus, and from Colombia. The greater part of these ties were procured from the north coast of Colombia, and were shipped to Colon from the port of Barranquilla. They were of a variety of wood commonly known as lignum vitae (*guayacum recina*), and now spoken of as black guayacum, to distinguish it from yellow guayacum, a wood of the same family, but with less power of resistance to mechanical wear or decay.

Other varieties of wood, such as balsamo (or quira), and polvillo, were procured by the company, but the only species available at the present time are a few balsamo ties, which were laid in the old track near Mount Hope in 1900, and which were taken out of the roadbed last year, and replaced by a larger tie. Practically, the only wood that has stood the test of time is the black guayacum, procured in the early days of the railroad's operations.

The guayacum ties procured by the old company were very small, being "pole" ties, about five to six inches thick, with a six to seven-inch face, eight feet long; some of them were quite crooked and irregular in shape. These carried the light traffic of the railroad prior to American Canal operations without difficulty, but when construction work was begun in earnest, it was found necessary to replace the small ties with those of a larger dimension.

There has been so much said about the long life of these hardwood ties that it would be well to set forth what little authentic information is available. The following are extracts from the annual reports since 1878:

1880—About 5,000 new lignum vitae ties have been placed in the track.

1884—During the year, 30,000 new lignum vitae ties have been put in, and during the coming year, 3,000 additional will be required.

1885—During the year 1885, 10,000 lignum vitae ties have been received and put in the roadbed. The existing contract for the 30,000 spoken of in the annual report of 1884 will complete the work for the present.

1886—The number of lignum vitae ties put in in the road in 1885 amounted to 10,000, while in 1886, over 20,000 have been received.

1888—The number of lignum vitae ties placed in the main line during the year was 5,456, and upon deviations, 8,747.

1889—Such is the durability of lignum vitae cross-ties used in the track that only 5,855 new ones were required for the year.

1890—The track has been kept in excellent condition, although only 4,014 lignum vitae ties were received during the year.

1891—The general condition of the roadbed and track continues excellent. Only 6,167 lignum vitae ties were laid during the year. The exceptional durability of these ties (about 30 years, when of good quality) reduces the number of yearly requirements to small proportions.

1892—Four thousand one hundred and twelve lignum vitae ties were laid.

1893—Four thousand five hundred and seven genuine lignum vitae ties were laid, and 2,539 of native hardwoods for sidings.

1894—Seven thousand one hundred and ninety-six lignum vitae ties were laid.

1895—Ten thousand two hundred and twenty lignum vitae ties were laid.

The main line of the railroad was first double-tracked from White House (near Las Cascades) to Tabernilla, to provide for the movement of the spoil trains to and from the Tabernilla dumps, and it was found necessary to remove many of the small hardwood ties from the roadbed in this section, on account of the increased traffic. These small ties were allowed to remain in the track in the section between Empire and Culebra, where the line was double-tracked, and where the traffic was comparatively light. There are many of these old ties still in use in the roadbed in that section.

The hardwood ties laid in the old track were, generally speaking, in very good condition. There were little, if any, signs of decay, but in many cases, especially with the smaller ties, they were badly worn at the rail seat by the mechanical action of the base of the rail, no tie plates being used on the ties. They were also "spike killed," caused by replacing spikes and changing rail. It will be interesting to note that many of the ties removed from the main track at that time, and later, are now being relaid on the tracks connecting wth the new terminal docks at Cristobal. The timber in the ties is practically as good as ever. As their smaller size is not objectionable in the yard tracks, it is expected that they will still have a long life in other services. Tie plates are not necessary with these ties, which results in some saving.

The mechanical wear on the old hardwood ties in contradistinction to the decay of the wood is demonstrated by the fact that while the base of the rail, and the driven spikes have cut into the hardwood and weathered it, the material in the balance is as good as ever. The same experience has, of

Digitized by Google

course, long been encountered and commented upon in the tie records of the United States. The difference between the experience there and here, however, lies in the fact that the ties referred to in the former records have probably not been used for a period longer than eight to ten years, while local hardwood ties are from 20 to 25 years old, and have been used in a tropical climate where all other wood decays in from three to five years.

The black guayacum cross-tie is probably a thing of the past. Such material is now so valuable for other purposes in connection with machinery and manufacturing arts, that it is not to be expected that it can be procured at reasonable prices for cross-ties. The Panama Railroad Company has procured only 4,000 or 5,000 guayacum cross-ties in the past six years, and most of these have been of the inferior variety known as yellow guayacum.

During the past few years guayacum cross-ties have been purchased under the following prices and specifications:

1898-1904.

First-class—6 by 8 inches, by 8 feet, $1.50 each.
Second-class—5½ by 6 inches, by 7.9 feet, $1 each.

1907.

First-class—6 by 8 inches, by 8 feet, $1.62 each.
Second-class—5½ by 7 inches, by 7.9 feet, $1.42 each.

1908-1910.

First-class—7 by 9 inches, by 8.6 feet, $2.10 each.
Second-class—6½ by 8 inches, by 8.3 feet, $1.75 each.

1911.

First-class—7 by 9 inches, by 8.6 feet, $2.25 each.
Second-class—6½ by 8 inches, by 8.3 feet, $1.75 each.

SPECIFICATIONS.

1. The material used shall be black or yellow guayacum, commonly known as guayacan or lignum vitae.

2. All ties shall be well and smoothly hewed out of straight growing timber of specified dimensions, and out of wind, sawed, or square cut ends, with straight and parallel sides and faces. All ties shall have bark entirely removed when cut. Ties shall be free of splits, loose, or decayed knots, or any other imperfections, which may impair their strength or durability. Not more than one inch of sap wood will be allowed, measured across the side or face.

3. Sawed ties will be accepted agreeing in other respects with the above paragraph, provided the saw cut extends throughout the length of the tie, making parallel sides and faces.

4. The width of the face and the thickness of the tie shall conform to sizes mentioned in the table of dimensions below, but a variation of size will be permitted of one inch over in thickness, one inch over in width, and three inches over in length. No variation in size under those specified will be allowed.

TABLE OF DIMENSIONS.

	Thickness. Inches.	Width of face. Inches.	Length. Ft. and In.	Maximum variation from straight edge. Top and bottom. Inches.	Sides. Inches.
1st class	7	9	8 6	½	2
2nd class	6½	8	8 3	1	3

Not more than 10 per cent of any particular shipment will be accepted as seconds, and it is desired to reduce this percentage as much as possible.

Personal

William C. Brown.

WILLIAM C. BROWN, president of the New York Central Lines, has resigned, effective January 1, 1914. His reasons for taking this action, according to a letter addressed to the directors of the four companies which comprise the system, are a desire to be relieved from the care, hard work and responsibility connected with the office and on account of a failing hearing which makes the performance of his duties either in the Board Room or in frequent important conferences, embarrassing. The various boards have accepted his resignation with regret, and have passed resolutions commendatory of the valuable service which he has rendered to the system.

Mr. Brown was born in the town of Norway, Herkimer County, New York, on July 29, 1853. When sixteen years of age he began his railroad career at Thompson, Ill., with the Chicago, Milwaukee and St. Paul Railroad as a section hand. While thus employed he devoted his evenings and spare time to helping the station agent, in return for which the station agent instructed him in telegraphy. In the spring of 1870, he was appointed operator at Charles City, Iowa. A year later he was night operator in the train dispatcher's office at Minneapolis.

In June, 1872, he entered the service of the Illinois Central as train dispatcher at Waterloo, Ia., and in March, 1875, went to the Chicago, Rock Island & Pacific Railway as dispatcher at Wilton Junction. On July 1, 1876, he began an uninterrupted service of twenty-five years with the Chicago, Burlington & Quincy Railroad Company. He entered the service as dispatcher at Ottumwa, Ia., and became successively chief dispatcher, trainmaster and assistant superintendent of the St. Louis division at Beardstown, Ill. On New Year's Day, 1887, he was given his first divisional superintendency. This was of the Iowa Mines at Burlington, Ia. In August, 1890,

Digitized by Google

WILLIAM C. BROWN.

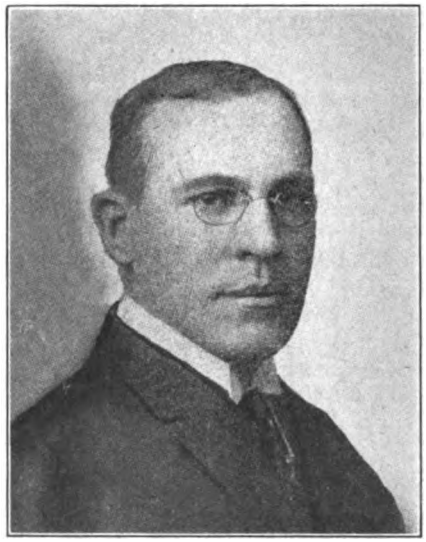
he was appointed general manager of the Missouri lines of the Burlington system.

His next promotion, again on New Year's Day, 1896, was to the position of general manager of the Burlington at Chicago. He relinquished this office on June 30, 1901, to enter the service of the New York Central lines as vice-president and general manager of the Lake Shore & Michigan Southern Railway Company, with headquarters at Cleveland. The twelve years of Mr. Brown's connection with the New York Central lines have witnessed a greater growth in those properties, and in the traffic handled by them, than any similar period in their history. During this same period the work of electrifying the New York Central in and about New York City was begun and carried to completion and the Grand Central Terminal was reconstructed in its entirety and greatly enlarged without interruption of train service and without a single serious accident to a passenger.

C. W. NELSON.

Clement W. Nelson.

CLEMENT W. NELSON, who has been appointed assistant to president of the St. Louis Southwestern Railway, was born at Morristown, Ill., July 12, 1870. He received a common school education and took his first position in railway service in June, 1889, with the American Express Company (Great Northern Railway). From September, 1890, to September, 1896, he was clerk, timekeeper, etc., in various departments of the Great Northern Railway, and from 1896 to June, 1899, chief clerk to superintendent on various divisions of the same road. Mr. Nelson went with the St. Louis Southwestern Railway in July, 1899, and until March, 1900, was chief clerk to the general superintendent. He was chief clerk to vice-president and general manager from March, 1900, to May 18, 1906. On the latter date he was appointed assistant general manager, a position he has held until his recent appointment, October 7, 1913, when he became assistant to president, St. Louis Southwestern Railway lines, with offices at St. Louis, Mo.



J. W. Newlean.

J. W. NEWLEAN, who has been elected vice-president and comptroller in charge of the financial accounting and supply departments of Wells Fargo and Company, with headquarters at Chicago, was born on October 28, 1875, in Chicago. He was educated in the public schools of Omaha, Neb., and began railway work on December 1, 1891, in the freight claim department of the Chicago, Burlington and Quincy. He went to the Union Pacific in March, 1892, and filled varous subordinate positions in different offices of the accounting department until July, 1901, when he was transferred to the service of the general auditor of the Union Pacific and the Southern Pacific, then known as the "Harriman System," and later was appointed chief clerk. In February, 1909, he became general auditor for the receivers of the Chicago Great Western, and in September of that year he was made auditor of the reorganized company. Mr.

Digitized by Google

Newlean was appointed general auditor of the Illinois Central and the Yazoo and Mississippi Valley in January, 1911, which position he held until March, 1912, when he became comptroller of Wells Fargo and Company. He is now elected vice-president and comptroller, as above mentioned.

James G. Woodworth.

JAMES G. WOODWORTH, who has been elected vice-president in charge of traffic of the Northern Pacific, with headquarters at St. Paul, Minn., was born October 31, 1864, at Hillsdale, Mich. He began railway work in 1879 as an office boy in the general freight department of the Chicago and North Western, and from May, 1880, to March, 1883, was telegraph operator and station agent at De Smet, S. Dak. He then became chief clerk in the general agent's office of the Chicago, St. Paul, Minneapolis and Omaha at Minneapolis, Minn., and in September of the following year went to the Union Pacific as freight solicitor at Portland, Ore. From January, 1886, to September, 1888, he was successively traveling freight agent and chief clerk in the general freight department of the Oregon Railway and Navigation Company. He was then made assistant general freight agent of that company, and in December, 1889, was appointed to a similar position on the Union Pacific, with headquarters at Portland. He was advanced to general freight agent of the Pacific division in July of the following year, and eight months later became assistant general Western freight agent at Portland, being transferred to Omaha, Neb., in November, 1802, as assistant general freight agent. Mr. Woodworth left the Union Pacific in July, 1893, and for one year was general freight agent of the Iowa Central. He returned to the Oregon Railway and Navigation Company as assistant to the receiver and general manager in July, 1894, and two years later became assistant to the president of that company. He was afterwards general freight agent from October, 1897, to October, 1899, when he became traffic manager of the Pacific Coast Company. He left the latter company to accept the position of assistant to the first vice-president of the Chicago, Burlington and Quincy in January, 1902, where he remained for three years, resigning to become traffic manager of the Northern Pacific. He held the latter office at the time of his recent election to the vice-presidency.

F. S. Holbrook.

FREDERICK S. HOLBROOK, general traffic manager of Wells Fargo and Company Express at New York, has been elected vice-president in charge of traffic. He was born on September 25, 1864, and began railway work in 1881, as a clerk on the Ogdensburg and Champlain, now a part of the Rutland, at Norwood, N. Y. From 1886 to 1889, he was chief clerk in the general freight office at Ogdensburg, N. Y., and then for two years was agent of the same road, also the Central Vermont and the Canadian Atlantic at Rouses Point. In 1890 he was made cashier of the Ogdensburg Transit Company at Chicago, and in 1894 became cashier of the Central Vermont at Pier 36, East River, N. Y., becoming commercial agent of the same road in 1896 at New York. He went to the West Shore in February, 1900, as assistant general freight agent, and left that company in March of the following year to become first assistant general freight agent of the New York, New Haven and Hartford at Boston, Mass. From July, 1901, to September, 1908, he was general freight agent of the same road at New Haven, Conn. In September, 1908, he became chairman of the committee on uniform classification at Chicago, and from May, 1909, to January, 1912, was chairman of the Official Classification Committee at New York. He was appointed general traffic manager of Wells Fargo and Company Express on January 1, 1912, and now becomes vice-president in charge of traffic of the same company, as above noted.

FREDERICK S. HOLBROOK.

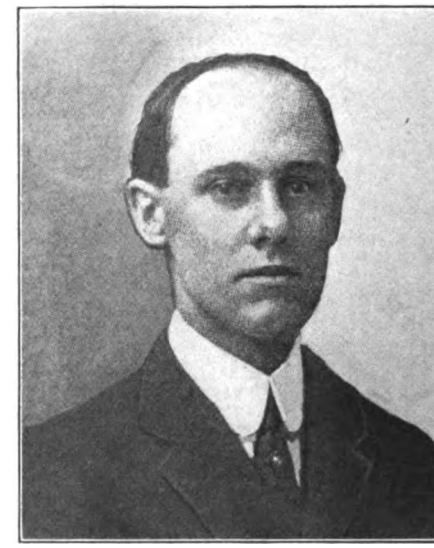
Thomas Milton Schumacher.

THOMAS MILTON SCHUMACHER, vice-president of the El Paso and Southwestern System at New York, has been elected chairman of the Board of the Chicago, Rock Island and Pacific Railway and of the Rock Island Company, succeeding D. G. Reid, also chairman of the executive committee of both companies, succeeding W. H. Moore. He was born on February 16, 1862, at Williamsport, Pa., and began railway work in 1879 as a telegraph operator for the Atlantic and Great Western. He then served in various positions on different roads in the operating department as operator, and in the train service until 1883, when he became clerk in the Missouri Pacific local office at St. Louis, Mo. From 1885 to 1887, he served as cashier, chief clerk and contracting agent at St. Louis of the Cleveland, Columbus, Cincinnati and Indianapolis. In 1887, he became chief clerk in the office of the general agent of the Union Pacific at Omaha, Neb., and three years later was made general agent of that road at San Francisco, Cal, which position he held four years. He was subsequently for two years vice-president and general manager of the Continental Fruit Express, with headquarters at Chicago, with the exception of about six months from November 1, 1901, when he resumed his former position. Mr. Schumacher was then until September, 1905, traffic manager of the Oregon Short Line, and subsequently for a short time was traffic manager of the United Fruit Company at New York. In 1906 he was made general traffic manager of the railroads and industrial companies controlled by Phelps, Dodge and Company of New York, with headquarters at Chicago, where he remained until December 1, 1909, when he resigned to accept the vice-presidency of the Denver and Rio Grande and Western Pacific, with office at San Francisco. Mr. Schumacher was appointed assistant director of traffic of the Union Pacific and Southern Pacific systems on May 1, 1910, with headquarters at Chicago, and on December 1, of that year, became traffic manager of the American Smelting and Refining Company and its allied companies with offices at New York. On November 1, 1912, he became vice-president of the El Paso and Southwestern system, also vice-president of the Nevada Northern and the Bingham and Garfield.

William J. Cunningham.

WILLIAM J. CUNNINGHAM, who has become assistant to the president of the New York, New Haven and Hartford, was born April 29, 1875, at St. John, N. B. He began railway work in 1892 with the Canadian Pacific as stenographer and ticket clerk in the passenger department at St. John, N. B., and Boston, Mass. In 1896 he went to the Boston and Albany as clerk in the superintendent's office at Boston, and three years later became statistical clerk to the general manager of the New York, New Haven and Hartford. From 1901 to 1907 he was employed in various capacities by the Delaware, Lackawanna and Western, his last position being assistant chief clerk to the general superintendent. In November, 1907, he became statistician of the Boston and Albany. When the Harvard Business School was established in 1908 Mr. Cunningham was engaged for two years as lecturer on railroad operation. In September, 1910, he was appointed assistant professor of transportation, but continued to act as consulting statistician for the Boston and Albany. Coincident with the election of Mr. Hustis as vice-president of the New York, New Haven and Hartford, Professor Cunningham was appointed vice-president's assistant, with headquarers at New Haven, Conn. Upon Mr. Hustis' promotion to the presidency, Mr. Cunningham became the president's assistant. To permit of the acceptance of this appointment for two years Harvard University has granted partial leave of absence for that time, and Professor Cunningham will continue to lecture at Harvard on one day per week.



WILLIAM J. CUNNINGHAM.

Alexander Hilton.

ALEXANDER HILTON, general passenger agent of the St. Louis and San Francisco, has been appointed passenger traffic manager, with headquarters at St. Louis, Mo. He was born at Hamilton, Ont., and began railway work

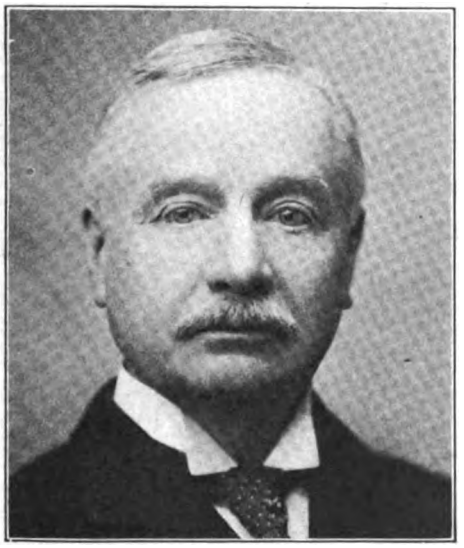
ALEXANDER HILTON.

in 1878, as a clerk on the Great Western Railway of Canada, now a part of the Grand Trunk. From 1880, to December, 1884, he was a clerk in the passenger department of the Chicago and Alton, and then to 1889 was city passenger and ticket agent of the same road at Kansas City. In 1887 he acted as Pacific Coast agent at San Francisco, Cal., and from 1889 to March 1, 1901, was general agent in the passenger department of the same road at Kansas City. On March 1, 1901, he was appointed assistant general passenger agent of the Kansas City, Fort Scott and Memphis; the following August he was made general passenger agent of its successor, the St. Louis and San Francisco, and now becomes passenger traffic manager of the same road. Since January 1, 1905, when the office of passenger traffic manager was abolished, he has assumed the duties of that position without change of title.



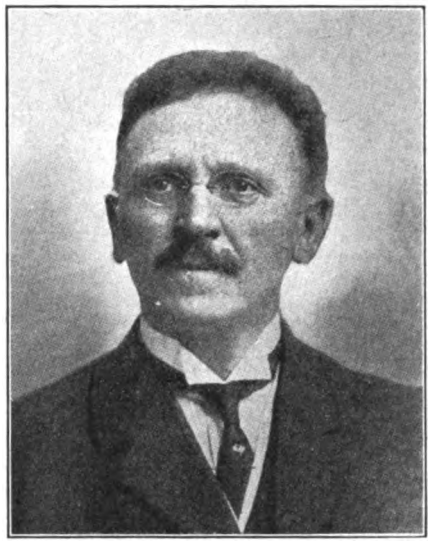
CHARLES W. JOHNSON.

Charles W. Johnson.

CHARLES W. JOHNSON, who has been chief engineer of the Chicago, St. Paul, Minneapolis and Omaha since its incorporation thirty-two years ago, resigned on November 1st, to become consulting engineer of the same road.

Mr. Johnson was born at Johnstown, N. Y., and educated in France and at Union College, where he took the degree of civil engineer in 1866. In 1867 he became assistant in the office of the chief engineer of the Lake Shore, and in 1870 assistant engineer of construction of the Rock Island. From 1871 to 1878 he was assistant and division engineer of construction of the Wisconsin Central.

He was made chief engineer of the Chicago, St. Paul, and Minneapolis Railroad March 1, 1879, and when ths property took over the St. Paul and Sioux City in 1881 and became the Chicago, St. Paul, Minneapolis and Omaha, he became chief engineer of the new road, with headquarters in St. Paul.



H. Rettinghouse.

H. RETTINGHOUSE, who has been appointed as chief engineer of the Chicago, St. Paul, Minneapolis and Omaha Railway, was born July 30, 1861, in Germany. He was educated there and came to the United States in 1882. In 1883 he was a rodman on the Wisconsin Central Railway. He was in a similar position in 1884 with the M. L. S. & W. Ry. and then successively instrument man and assistant engineer in charge of location, construction and maintenance. From 1893 to 1897 Mr. Rettinghouse was engaged in general engineering business at Ashland, Wis. He was assistant engineer of the Chicago and North Western Railway from 1897 to May, 1900, and superintendent of bridges and buildings on the Ashland division of the same road from May, 1900, to February, 1905. He was division engineer of the Wisconsin Central Railway, Southern division, for two years, and then was appointed division engineer of the Chicago and North Western at Boone, Iowa. He was made superintendent of the Iowa and Minnesota

Digitized by Google

divisions at Mason City, Iowa, on April 1, 1912. His appointment as chief engineer of the Chicago, St. Paul, Minneapolis and Omaha Railway is effective November 1.

E. J. Devans.

E. J. DEVANS, who recently was appointed general superintendent of the Buffalo, Rochester and Pittsburgh, was born in 1867, at Medina, N. Y. Educated in public schools; entered railway service in May, 1883, as telegraph operator with the New York Central, and worked successively with the New York Central, Delaware, Lackawanna and Western, Western New York and Pennsylvania, and West Shore railroads as telegraph operator and agent until 1888.

He entered the service of the Buffalo, Rochester and Pittsburgh as operator and agent in October, 1888, was transferred to superintendent's office as clerk in September, 1889, and in April, 1893, was transferred to copier in the train dispatchers' office; appointed train dispatcher in August, 1893; appointed chief dispatcher and trainmaster, September, 1899.

Mr. Devans served as special representative to the general manager from May, 1905, to March, 1907; appointed superintendent of Rochester and Buffalo divisions in March, 1907; appointed general superintendent of the Buffalo, Rochester and Pittsburgh Railway, October 1, 1913. This position had been vacant for the past two years, the duties of both positions being looked after by the general manager, Mr. T. F. Brennan.

D. C. Douglass.

D. C. DOUGLASS, who was recently appointed general manager of the Maine Central, was born February 2, 1877, in Leeds, Maine; entered railroad service in July, 1894, and employed until November 10, 1897, as stenographer in passenger traffic department and to the general manager, Maine Central Railroad Company; from November, 1897, to February 15, 1910, secretary to general manager and vice-president and general manager, same company; February 15, 1910, to July 10, 1913, assistant to vice-president and general manager, same company; July 10 to October 15, 1913, assistant to the president, same company, and October 16, 1913, appointed general manager, Maine Central Railroad Company and Portland Terminal Company.

Joseph Paxton Blair.

AS general counsel of the Southern Pacific Company, to which office he has been recently appointed, Mr. Blair's unusual attainments especially qualify him to successfully handle those complex problems incident to the transportation development of his company.

Joseph Paxton Blair was born December 5, 1859, at Columbus, Miss. His father was David Paxton and his mother Elizabeth Armstead (Pope) Blair. He comes of Scotch-Irish stock through his paternal ancestry, while on the maternal side he is of English descent.

Mr. Blair's education was obtained at the University of Virginia, from which institution he received the degree of A. M. in 1882. During his college days he was the classmate of President Woodrow Wilson.

Removing to Louisiana in 1882, Mr. Blair became assistant professor at the University of Louisiana, now Taulane University, in which position he remained for two years. Having studied law and gained admission to the Bar, he began practice in New Orleans in 1884, in the offices of Judge Edward D. White, now Chief Justice of the United States. Later he became a member of the law firm of Leovy and Blair, of New Orleans, his partner being Mr. Henry J. Leovy. In 1895 he entered into partnership with Mr. George Denegre, the firm name being Denegre and Blair. In this partnership he continued his professional activities with notable success until November 1, 1913, when he was made general counsel of the Southern Pacfic Company, with his principal office in New York City.

GEORGE W. ROBB.

Digitized by Google

George W. Robb.

GEORGE W. ROBB, who was recently appointed superintendent of motive power of the Grand Trunk Pacific Railway, with headquarters at Transcona, began his railway service in 1881 as car repairer and apprentice for the Grand Trunk. In 1885 he was made improver at Toronto and in 1886, machinist for the Canadian Pacific at Winnipeg. In 1888, he became night foreman of St. P., M. & M. and in 1889, became day foreman for the Great Northern at Wilmire. In 1891 he went to the Chicago Great Western as locomotive foreman and in 1895 became shop foreman for the Canada Atlantic from which he was promoted to general foreman in 1895. 1908 found him with the Grand Trunk Pacific as assistant master mechanic and one year later he was promoted to the position of master mechanic, which he held until his recent appointment.

R. Quayle.

R. QUAYLE, who was recently appointed general superintendent of motive power and car department of the Chicago and North Western, entered railway service with the Chicago and North Western Railways, as an apprentice to the machinist trade, in 1871, and was gang foreman in charge of construction of new locomotives for three years; was foreman of the machine end of the car department about five years, during which time he was also draftsman for the car department, and in 1885, he was appointed master mechanic in charge of motive power and car departments in the state of Iowa, with headquarters at Clinton, Iowa; in 1891 he

R. QUAYLE.

accepted position as general master mechanic for the Milwaukee, Lake Shore and Western Railway, in charge of motive power and car departments, and the Chicago and North Western Railway absorbed the former road in 1893, and December 1, 1894, he was made superintendent of motive power and machinery of the Chicago and North Western Railway, and November 1, 1913, made general superintendent motive power and car departments.

Financial

Unsatisfactory Railway Earnings.

SEPTEMBER returns furnish emphatic testimony that the increases in railway expenses are more than offsetting the gains in gross revenues. Furthermore, the gains in gross are on a diminishing scale, there being an actual falling off in the case of many roads. The latest figures compiled by the *Financial Chronicle* show that the gross earnings for 459 roads for the month of September amounted to approximately $285,000,000, while the operating expenses were $192,000,000, leaving net earnings of nearly $93,000,000. In September, 1912, gross earnings totaled $275,000,000, operating expenses $177,000,000 and net earnings $98,000,000. In other words, net earnings for September of the present year, showed a decrease of over $5,000,000 as compared with those of 1912. In view of the $6,000,000 increase in expenses recently forced upon the railroads by the award of the Arbitration Board in Eastern trainmen's wage controversy, the outlook cannot exactly be viewed with complacency.

In addition to this unfavorable trend shown in September results, preliminary returns in October's gross indicate a sharp and quite general decrease as compared with the results for the tenth month of 1912. For example, the Colorado and Southern, shows a decline of over $300,000, Indiana and Great Northern nearly the same amount, Missouri, Kansas and Texas $265,000, Chicago and Alton $216,000, Texas and Pacific $171,000, Wabash $148,000, etc. In fact Western roads, Southern roads and roads in the Southwest, quite generally report losses. This means of course a falling off in railway traffic due to smaller grain movements and to generally unsettled business conditions, but with operating expenses remaining high, with costly legislation constantly being placed upon the statute books, and with boards of arbitration adding to the carriers' burdens, it takes rare optimism to gather any amount of encouragement from the outlook.

As to the trend shown in the more complete September figures, the "Financial Chronicle" has the following to say:

"The advance in operating cost is becoming year by year a more pronounced feature in the revenue returns of the railroads. In September last year the gain in gross revenues was of more satisfactory proportions, but the net, even then, failed to keep pace with the rise in gross receipts. In other words, our September statement for 1912 showed $19,891,032 increase in gross, or 7.88 per cent, but this was attended by an addition to expenses of $13,855,420, or 8.58 per cent, leaving, therefore, only $6,035,612 increase in net, or 6.64 per cent. Extending the comparisons further back, we find that in September, 1911, our compilations showed only minor changes in the totals, namely, $39,801 increase in gross and $1,321,815 increase in net. In September, 1910, there

Digitized by Google

was a gain of $10,312,116 in gross revenues, but attended by a loss of $3,869,083 in net earnings showing that rising expenses were even then a most striking feature. In the year preceding, results for this month were much more encouraging—that is, in September, 1909, there was $27,052,253 gain in gross and $13,585,396 gain in net. In September, 1908, on the other hand, there was $15,299,307 loss in gross, with $4,083,435 gain in net. In September, 1907, the returns were very incomplete, they coming to hand when the panic of that year was at its height. The significant feature is that at that time, also, net earnings were falling behind, though gross was still expanding; stated in brief, for September, 1907, our compilation, though incomplete, registered $13,172,222 increase in gross with $3,594,503 decrease in net."

The Bureau of Railway Economics, in its complete returns for August, which it reduces to a per mile of line basis, and then makes a comparison with returns for August, 1912, shows an increase in total operating revenues per mile of 0.6 per cent, and an increase in operating expenses per mile of 7.1 per cent. Net operating revenues per mile were less by $48.00, or 10.9 per cent than for August, 1912, while those for August, 1912, was 11.1 per cent greater than for August, 1911. The following diagrams graphically illustrate the monthly and cumulative trend of railway earnings during the first eight months of the calendar year.

The Future of Railroad Financing.

By JAMES J. HILL.

IN a recent notable address before the Investment Bankers Association of America at Chicago on October 30th, James J. Hill, vigorously denounced the present tendencies in fi-

nancing particularly with regard to municipal and public bonds. The following paragraphs from this address relate more particularly to the railway situation. Mr. Hill asserts that the methods which have characterized the issuance of railway bonds have been the soundest of all classes. In part he says:

"Without undue preference for the interest to which most of my active life has been given, I think I may say that the railroad bonds of this country as a rule have remained faithful to their trust. For one thing, it is practically impossible to place an over-issue of railway bonds. If a manufacturing or commercial concern liquidates, its property has only current real estate value unless some successor wishes to carry on the same or a similar business. If an industrial enterprise is wrecked by competition that it cannot meet, by a shift in the market for raw materials, by a cessation of demand owing to changed conditions or new inventions, its bonds may fall to a few cents on the dollar; because the intangible values behind them are reduced to nothing, and the tangible can no longer be turned to profitable use. A railroad is differently situated. Its business cannot be discontinued. While it may and does suffer from unjust legislative and other assaults that add to its expenses and subtract from its revenues, it enjoys as a compensation security through the courts against actual confiscation. The road and its belongings will always remain there. They can always be operated. They must be operated by somebody. Therefore the security cannot altogether vanish; and experience has shown that it will eventually bring, under wise management, some return in the most desperate cases.

"So far as the old, established properties, with an unbroken record for payment of interest and dividends, are concerned, there is no security that can compare with them for safety of the principal and certainty of the interest payment. The United States Government itself has been compelled to suspend specie payments; but the best railroad systems of the country went through the stress that drove it to the wall without disappointing investors in them of one dollar when it was due or expected. There never was a bond issue through the centuries since the word first came into use which better deserved to bear the title than the first-class railway bonds that are the favorite investment to-day of the great life, fire and accident insurance companies, of savings banks, of all who make it their first condition that a security shall have full value behind it, pay at maturity, and be readily convertible into cash with the least shrinkage, even in time of public panic and financial demoralization.

"Limitations by law on increase of capitalization are of recent origin. The managements of our railways have, for the most part, financed them voluntarily, so far as bond issues at least are concerned, moderately and wisely. The amount of railway capital outstanding in 1911 was, of official report, a little over $19,000,000,000. Of this, $10,738,000,000 was funded debt, $7,825,000,000 of the amount being bonds. There is no present means of estimating the total money value of railroad property. We do know that it represents the greatest property interest in the country next to the land on which we live and its improvements. It is so far in excess of capitalization that the margin of safety is plainly in view. It is so much farther from the total of the railway bonded debt that the most careful administrator of a trust never guarded it more completely against possible depreciation.

"I showed six years ago that the actual growth of the transportation business called for an immediate investment of at least one billion dollars a year for five years, to catch up with traffic demands. The event proved that forecast under instead of above the mark. The need grows continually with the increase in population and the development of the country. The money obtained by the sale of securities is put into construction and equipment. So we need not be surprised to learn, according to an estimate made by the New York *Times*, that while, in the year ending October 1, 1912, the railways issued stocks and bonds to a total of $23,821,000 less than the year preceding, the industrial concerns issued $362,000,000 more. The remaining class of bonds, those of public utilities, require no separate discussion. Water bonds in most cases stand on the same footing as those of the municipality; gas and electric light bonds are simply a special form of industrials; while street railway bonds resemble those of the steam railways, except that generally a mere franchise instead of an ownership of property is the main guarantee behind them. The creation of public utilities commissions in various states tends to consolidate or standardize all these, so far as their sanction and security are concerned, into a special class of state-approved but not state-guaranteed security.

"This survey and analysis should explain whatever may seem mysterious or discouraging in the recent course of the bond market. In spite of the care with which men who understand and respect the limitations of credit attempt to guard and restrict bond issues, the grand total mounts so fast and the security is so progressively impaired that the investor hesitates. Those who are desperate for capital bid higher. The rate of interest rises. So does the risk. And these results, unhappy for the borrower, unhappy for the lender, discouraging and dangerous for the community, will continue until the country reconsiders and amends its ways. The two noticeable features of the general bond situation are the extraordinary conservation in the increase of the railway bonded debt and the extraordinary recklessness of public authorities and the managements of industrial enterprises, taken as a whole, in forcing out every dollar of bonds that anybody will take, until they must finally be advertised as summer sales and peddled out over the bargain counter. Less spending for purposes that can wait; less borrowing on any terms; and a clear distinction between the different classes of security and instruments of credit, so that each shall make its own appeal and cherish its own value, are the only conditions upon which improvement can be hoped. The investment market cannot know a prosperous activity, except by feverish starts to be followed by still more pronounced reactions, until the immutable laws of credit have been generally recognized and respected.

* * * * * * *

"After all has been said, the main explanation of prevailing conditions in the bond market runs back to the old law of demand and supply. There has been too much spending and borrowing. The individual, the corporation, the municipality is no longer willing to pay as it goes. The future is mortgaged until the interest charge alone absorbs more current revenue than can be spared. This

Digitized by Google

is the standing danger, the crowning abuse of credit, from which no age has been free. It has been the cause of every act of currency inflation, always aggravating the evil. Inflation by bond issues in excess is just as dangerous in practice, produces the same effects and leads to the same end. Correct this, and the troubles of the market will be relieved; since credit always adjusts itself automatically to the public need when freed from artificial stimulation or compulsion. Let the present abuse of credit continue, and an abyss of possible suffering and financial distress opens before us. This need not happen. It will not happen if the wiser counsel and the conservative view reassert themselves."

British Railway Earnings.

THE annual reports of the British Board of Trade giving the Railway Returns of the United Kingdom illustrate conditions where a large volume of traffic is moved over relatively short routes. The recently issued report, for 1912, gives the total railway mileage in the Kingdom as 23,441; of which 16,223 were in England and Wales, 3,815 in Scotland, and 3,403 miles were in Ireland. This refers to length of line and does not include second tracks, third tracks, sidings, etc.

The earnings for 1912 amounted to $625,603,000, one half of which came from freight traffic; the other half came from passenger traffic and miscellaneous sources. The average dividend on ordinary capital was 3.45 per cent in 1912, a slight decrease compared with the 3.62 per cent paid in 1911.

British railways earned in 1912, from traffic, an average of $1.38 per train mile. The average for the United States, where a train carries more, exceeds $2.00. However, trains are much more numerous on British than on American railways and the operating revenue per mile of road in the former country was $24,562, or nearly two and one half times the average traffic earnings per mile of American railway.

Of the $264,047,000 received by British railways in 1912 for passenger traffic, third class passengers paid $167,096,000; season-ticket holders, $24,741,000; first class passengers, $17,675,000, and second class passengers, $5,738,000. Earnings from mails, parcels, excess baggage, etc., amounted to $48,797,000. Third class passengers numbered 1,249,374,000 out of a total of 1,294,337,000 for all passengers except season-ticket holders.

The principal class of freight traffic, "general merchandise" yielded a revenue of $162,711,000; minerals paid $141,980,000; and live stock, $7,003,000; makig a total reveuue from freight of $311,694,000.

Decline in the Average Price of Stocks.

THE following diagram prepared by the New York *Times* graphically portrays the decline in leading railroad and industrial stock which have occurred during 1913. As this chart indicates, the lowest average was reached in June, although October's showing is scarcely

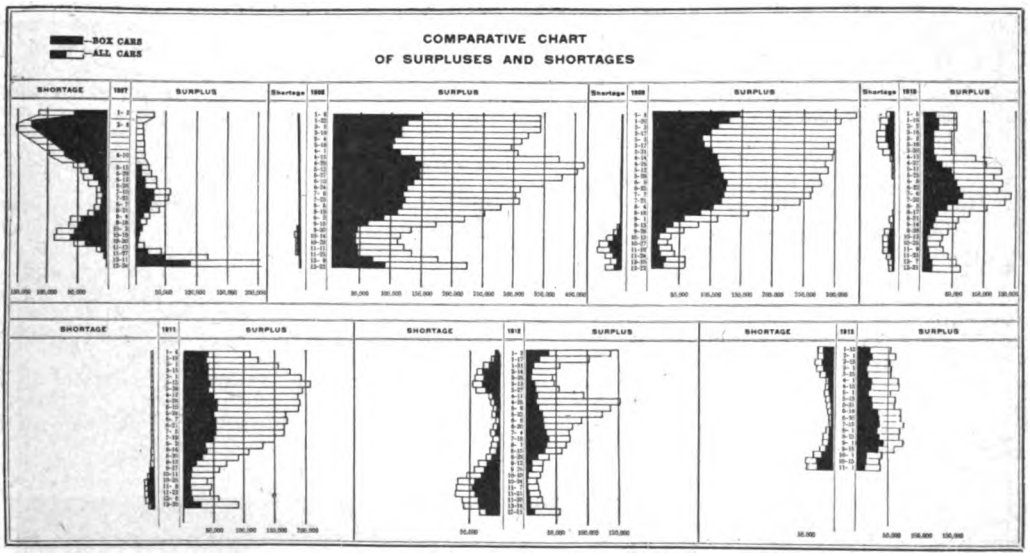
better. With the effect of the tariff still unmeasured and the rapidly increasing cost of railway operations, it is hard to estimate what the future has in store.

Operation

The Car Situation.

THE latest figures of the American Railway Association indicate that the anticipated car shortage will probably not be so severe as feared. On November first, the total surplus of cars amounted to 38,276, while the total shortage was 40,118, making a net shortage of not quite 2,000 cars. The total surplus on October 24, 1912, the nearest comparable date, was 17,289 cars, while the total shortage for the same date was 67,270, or a net shortage of approximately 50,000 cars. These comparisons indicate clearly the improvement in the situation for this year. They also apparently indicate a decline in business as compared with last year, although such a comparison is subject to certain important modifications.

The following comparative chart prepared by the American Railway Association shows greater evenness in the car supply for 1913, than for any of the past seven years:



Statement of Freight Car Balance and Performance for June.

THE Commission on Relations between Railroads of the American Railway Association has issued its statement of freight car balances and performance for June, which shows that the miles per car per day for that month were 24.3 compared with 25.0 in May. The figure for June, 1912, was 24.1. Ton miles per car per day for June were 377, compared with 387 in May. This is an increase of 3.01 per cent over the figure for June, 1912, which was 366. The proportion of home cars on line increased two points to 58 per cent over the preceding month, but was the same as in June, 1912. The per cent of loaded car mileage increased from 68.7 per cent in May to 69 per cent in June. This figure for June, 1912, was 69.3 per cent. The average earnings per car per day for all cars on line decreased eight cents from the figures of the previous month, or to $2.47. The figure for June, 1912, was $2.49.

Second Safety Congress.

THE Second Safety Congress of the National Council for Industrial Safety convened in New York on September 23d. The feature of the Congress aside from the various addresses delivered by men prominently identified with safety work, was the "Safety Man's Round Table." This "round table" constituted a free for all discussion of safety problems and by attending the various sessions much information of a practical nature was obtained by those who are in the vanguard of the greater safety movement. Each day of the Congress was opened with a "round table" meeting.

A number of railway men were present, among whom were H. L. Brownell, of the Safety Bureau of the Chicago Railways, who reviewed what his Bureau has done to minimize street railway accidents in Chicago, by educating the public against accident prevention. Mr. Brownell illustrated his talk with a series of motion pictures to show how accidents are caused by the carelessness of employes and by the public. He also stated that the motion pictures had been shown in the city parks of Chicago twelve times, and more than 50,000 persons have seen how accidents happen and how they may be avoided.

C. R. Richards, chairman of the Safety Committee of the Chicago and North Western, was another railroad man present. He asserted that the safety first movement among railroads was begun by his road and that 68 other railroads have adopt-

BANQUET OF THE SECOND SAFETY CONGRESS OF THE NATIONAL COUNCIL FOR INDUSTRIAL SAFETY, HELD IN NEW YORK ON THE EVENING OF SEPTEMBER 23RD.

ed similar plans. It is a man's movement he said and it is up to the men to make it a success. Speaking of the results on the North Western, he said that the personal responsibility of employes had been developed to such an extent that not only has there been a sweeping reduction in casualties but there has also been an increase of 12 per cent in the earnings of the road as well. A feature of the gathering was the safety banquet enjoyed by the National Council for Industrial Safety with its parent organization, the Association of Iron and Steel Electrical Engineers. Governor Tener, of Pennsylvania, acted as toastmaster.

Pennsylvania Railroad's Safety First Exhibit.

AN interesting "Safety First" exhibit was recently made by the Pennsylvania Railroad at its New York station. Fully 4,000 visitors, mostly employes, attended the exhibit which continued for a week, beginning on September 26th. The articles shown were numerous and varied from a rusty nail to a whole section of track. Among the specially interesting exhibits were a section of track, a miniature telegraph line, various machines and tools, guarded and unguarded, boards showing nails projecting, protected and unprotected station platforms, barrels and boxes of freight properly and improperly piled on floor and hand trucks, safe and unsafe devices for operating purposes, and hundreds of photographs illustrating the safe and unsafe methods of working on cars, tracks, etc. Not only were demonstrators present to show and to explain the right and wrong methods of handling machinery, tools, etc., but at the evening sessions, practical demonstrations by employes of the first aid to the injured were given. The accompanying illustration gives some idea of the manner in which these realistic demonstrations were made.

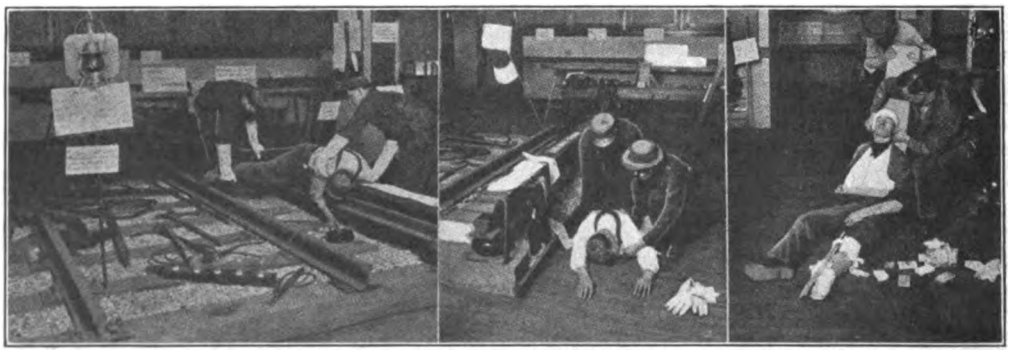
"Don'ts" on the Chicago Great Western.

THE Chicago Great Western Railroad men have entered upon an active campaign along the general lines of safety, and to that end have perfected a safety organization including all divisions and departments and have adopted as their motto, "Safety Always."

The following are some of the "Dont's" which have been adopted:

Don't trespass on railroad properties; it is tempting fate unnecessarily.

Don't step off one track onto another to let a train pass; keep clear of all tracks.



PENNSYLVANIA RAILROAD'S SAFETY FIRST EXHIBIT AT NEW YORK.

In the first photograph employes are seen removing victim from contact with third rail. In the second photograph, victim is being resuscitated from an electric shock, and in the third, employes are demonstrating treatment for burns, bruises, etc.

Don't stand on or near the track for any purpose whatever.

Don't permit children to go upon the track for any purpose whatever.

Don't attmept to cross a track in front of a moving train; wait until it passes.

Don't attempt to cross a track without first stopping and listening, and looking in both directions to see if a train is approaching.

Don't get on or off trains while in motion.

Don't allow boys to indulge in the dangerous practice of jumping on and off moving cars or trains.

Don't place suitcases, satchels or other heavy packages in racks in coaches as they are liable to fall out and injure those sitting underneath.

Don't throw banana peels, orange peels or other fruit or refuse on floors of stations or cars, out of car windows at stations or in other places where they are liable to be stepped upon.

Competition for Harriman Memorial Medals.

LEADING railroads throughout the country are in the competition for the first award of the E. H. Harriman Memorial Medals, which will be made at the First International Exposition of Safety and Sanitation, to be held in New York City, December 11th to 20th, under the auspices of the American Museum of Safety.

Several notable names have been added to the Jury of Award, including Vincent Astor, Mabel T. Boardman, and John H. Finley. The complete jury now consists of Jane Addams, Vincent Astor, Mrs. August Belmont, Surgeon-General Rupert Blue, Mabel T. Boardman, George B. Cortelyou, John H. Finley, Irving Fisher, Elbert H. Gary, Professor F. R. Hutton, Joseph Johnson, J. B. McCall, president of the National Electric Light Association; Dr. William H. Nichols, John H. Patterson, F. E. Rogers, B. B. Thayer, Lillian Wald, W. T. Wilson.

The Safety Exposition will be the occasion of the annual meeting and dinner of the American Museum of Safety which will be held at the Waldorf-Astoria on the evening of December 12th. One of the speakers will be President Arthur T. Hadley, of Yale. The dinner committee consists of James Speyer, George B. Cortelyou, Judge E. H. Gary, Dr. George F. Kunz, and Dr. William H. Tolman.

All of the awards will be made on this occasion including the Harriman Memorial Medals, the Safety Exposition Medals, and the annual medals of the American Museum of Safety, consisting of The Scientific American, the Travelers, the Seaman and Rathenau medals.

Rock Island Hospital Car.

IN furtherance of its "safety first" movement, the Rock Island road has equipped a hospital car which it has located at the track elevation work being done within the city limits of Chicago. There are 600 men employed in this work and the car is intended to meet any accident emergency which may arise. The car is 34 feet long, the inside of which has been covered with a cloth and painted with an enamel paint. It is divided into two compartments by a screen partition both of which compartments are shown in the accompanying illustration. Half of the car is provided with an operating table and accessories and the other half with suspended spring beds which are so constructed that they move freely in any direction thereby greatly dissipating any shocks that the car may receive. It is evident that the possibilities of such a car are not limited to the above service.

THE CAUSE OF THE STOCKWELL DERAILMENT.

THE chief inspector of safety appliances of the Interstate Commerce Commission has issued a report regarding the derailment of a passenger train on the Chicago, Cleveland, Cincinnati and St. Louis Railway at Stockwell, Ind., on January 7th. This wreck which occurred on a straight track with good roadbed, was caused by the breaking of a tire on one of the wheels of a baggage truck and resulted in the death of one person and injuries to seventy others. At the time of the accident, the train was running at the rate of 55 to 60 miles per hour. Included with the report of the chief inspector, is one by the engineer physicist of the United States Bureau of Standards, to whom the tire was sent for inspection and analysis. His report deals at length with shrinkage strains and thermal cracks, a combination of these, in his opinion, being the cause of the tire rupture.

The train was made up of a Pacific type locomotive and seven cars, these being in the order given, a mail car, a baggage car on which the defective tire was located, a day coach, a cafe car, a Pullman and a chair car; all of which, except the locomotive and the mail car, left the rails. The cars of this train received the usual inspections at Cincinnati, where the run originated, and at Indianapolis, where it arrived about three hours after leaving Cincinnati, the wreck occurring about one and one half hours after the last inspection at Indianapolis. No defects of sufficient consequence were detected by the inspectors to warrant laying out the baggage or any other car of the train.

"Events at the time of the wreck," according to the report, "probably occurred in about this manner and sequence. The tire on the right-hand wheel of the forward axle of the forward truck of baggage car fractured radially in one place, was forced off the wheel center into the axle which it encircled, and was carried along by the latter throughout the time of derailment. The fracture of the tire caused the derailment of its truck and precipitated the wreck of the train, the first intimation of which came to the engineer and fireman by the setting of the brakes when the train parted, which occurred between the mail and baggage cars.

"In point of time the fracture of the tire preceded the derailment of the train, but how much earlier is conjectural. Probably it occurred within a mile or a few miles of the place of derailment. The character of the fracture was such that, while it is believed to have been the extension of a thermal crack previously existing in the tire, its development by stresses in the track and complete separation would take place very promptly when the final stage was reached. The shrinkage of the tire upon the wheel center was the chief element of strength, or resistance, which kept it in place when intact. When fractured this resistance was lost, and only the strength of the rivets of the retaining rings would then be available for holding it in place. Successive side lurches of the car, common to all train movements, overcame the strength of the rivets by flange blows, ultimately forcing the tire off the wheel center.

"The car was built in 1906 and placed in service in September of that year. It had four-wheel trucks, 36-inch wheels with steel tires on steel centers, size of journals, 5 by 9 inches. The original thickness of the fractured tire was 3⅛ inches and it was 2 9-16 inches thick at the time of derailment. Total mileage made was 111,113 miles, 60 million rotations in round numbers. The car was in the shop in March, 1912, and the tires were then trued up. The contour lines were satisfactory at the time of derailment and it was not a very much worn tire."

The report comments on the method of assembling wheels of this type whereby shrinkage strains are introduced, and states that "the greatest factor in the case, however, is the application of the brakes. The tread is suddenly heated by the friction of the brake shoe and the tire expanded before the center is affected, no doubt causing wide fluctuations in the magnitude of the shrinkage strains. Momentarily the tire may be left with very little shrinkage resistance when

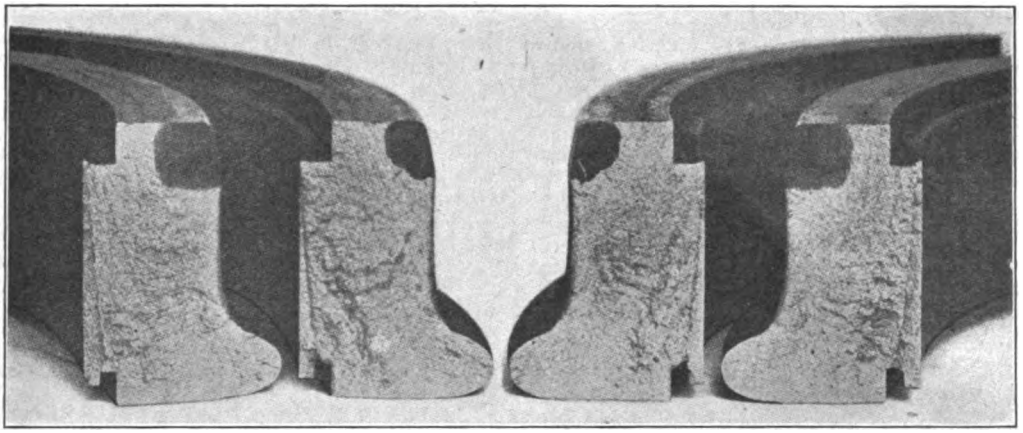
ANOTHER VIEW OF FRACTURED TIRE ON WHICH ARE INDICATED BY CHALK MARKS, LOCATION OF THERMAL CRACKS ON OUTSIDE OF TIRE MEASURING ½ INCH OR MORE IN LENGTH.

Digitized by Google



THERMAL CRACKS WHICH DEVELOPED IN THE TIRE WHILE IN SERVICE.

there is a sudden application of the brakes. * * But the sudden heating of the treads of wheels and the attainment of high temperature assumes a more serious aspect than causing the temporary reduction of shrinkage resistance. Thermal cracks in the steel are formed in this manner, the presence of which is a menace to the integrity of the tire. * * * They are caused by the rapid cooling of the intensely heated metal where free contraction is resisted. * * The cause of the wreck of this train was not material defective in its primitive state, but that which had became so apparently from braking conditions."

The conclusions arrived at are:

"That the derailment and wreck was caused by the fracture of the steel tire on the right-hand forward wheel of the forward truck of the baggage car.

"That the retaining rings and rivets in the construction of the wheel did not have adequate strength, shrinkage resistance having been lost, to hold the fractured tire on its wheel center.

"That the fractured tire, insecurely held, was forced off its wheel center by side thrusts usual to train movements, thus precipitating the derailment.

"That the fracture of the tire was occasioned by the presence of deep thermal cracks in the tread, one of which had separated the metal of the tire to a depth of one half its thickness and had an area of over 1½ square inches.

"That these cracks were visible on the surface of the tread and the edge of the outer end of the tire.

"That the formation and extension of these cracks was due to the heat generated under the brake shoe.

"That adequate means should be employed to hold a tire of this type on its wheel center independent of shrinkage resistance.

"That the presence of thermal cracks on the tread of a tire is suffiicent cause for the removal of the wheel from service, which should be done."

AN OBSERVATION CAR ELECTRIC SEARCH LIGHT.

THE accompanying illustration shows an electric searchlight equipment installed on the observation car of the fast mail train operated between the Twin Cities and Chicago on the Chicago, Milwaukee and St. Paul Railway.

This searchlight is 13 inches in diameter and stands on a pedestal 52 inches high over all, taking up 16 inches of floor space on the observation platform. The carbons are ½-inch by ⅝-inch specially constructed for searchlight work. The

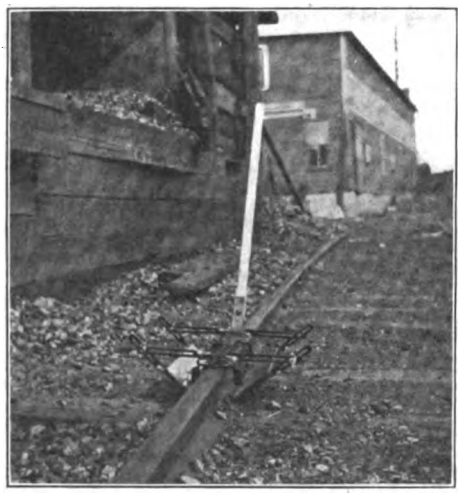
Digitized by Google

carbons stand horizontally and operate automatically after being focused. The lamp is built to operate on a 60-volt electric current and requires 20 amperes, throwing a stream of light for a distance of two miles. The lamp is mounted on the observation car platform at the end of the train and it is in charge of an experienced operator providing a means by which the passengers on the train can view the scenery after nightfall.

A Rail Inspecting Device.

A GRAND RAPIDS, MICH., man has invented an apparatus by means of which flaws or breaks on the underside of rails can be readily detected. In rail inspection by track walkers, the top of the ball and flanges may



A Device so Constructed with Mirrors as to Permit, by Reflection, an Examination of the Web and the Undersides of the Ball.

be readily examined by a person walking in an upright position, but to examine the web and the underside of that ball is a slow and laborious operation requiring the track walker to assume a stooping posture every few minutes and often at times to crawl upon his hands and knees. This is fatiguing and apt to induce the track walker to shirk or to make a less careful examination than he should.

The device herein illustrated, and which can be passed along the track by a person walking in an upright position, reveals by reflection the sides of the web and the undersides of the ball. It consists of one or more mirrors suitably mounted on a handled carrier by which it can be conveniently moved along the rail with the mirrors in such a position as to permit inspection of that part of the rail not seen from above. In one form the mirrors are held by two solid arms while in another, the device has various adjustments.

As indicated in the illustration there are extending laterally from the saddle four twisted arms, two on each side—having slots engaging upwardly extending arms that are held rigid with the mirrors by means of brass thumb nuts, which clamp the arms securely in any position of angular adjustment. The device is pushed along the rail by the handle that extends backwards at an angle of 30 degreees, while the saddle or frame has depending lugs or flanges ahead and behind which fit loosely to the rail, and to which small pieces of spring steel are riveted so that the shear of the ball of the rail will not hinder the movement of the device.

The device complete weighs about ten pounds. The handle being at the rear and the supporting arms at the ends of the mirrors, it permits the trackwalker an unobstructed view into each mirror at all times.

Vanadium Steel and its Application to Locomotive Construction.

THE Western Railway Club at its September meeting listened to an interesting address by Mr. George L. Norris, of the American Vanadium Company, on the development of the application of vanadium steel to locomotive construction. The growth and extent of its use is graphically shown in the curves of the accompanying chart:

Curve "A" shows the number of new locomotives equipped with vanadium steel parts, built in each year from 1908 up to and including 1912, and the number ordered during the first five months of this year with vanadium steel specified.

Curve "B" shows the percentage of all the locomotives built yearly in which vanadium steels have been used. Analysis of these curves brings out some interesting facts as to the extent to which vanadium steel has come to be applied to locomotive construction.

In 1908, when several of the leading railroads specified vanadium steel parts for test purposes, only fifty-three locomotives were so equipped, or two per cent of the total number built that year. Awaiting the outcome of these tests but little vanadium steel was specified on locomotives built during 1909, as shown by the downward trend of both curves. Evidence of the success of these tests is shown by the marked increase in the specification of vanadium steel for locomotives built in 1910, as shown by the abrupt rise

VANADIUM FRAME MADE BY UNION STEEL CASTING COMPANY, WHICH WAS BENT UNDER A DROP BY 15 BLOWS AT 17 FEET, AND ONE BLOW AT 15 FEET, WITH A 3,000 POUND BALL, A TOTAL IN ALL OF 810,000 FOOT POUNDS.

in both curves. From 1910 the use of vanadium steel in locomotive construction has been steadily increasing.

The drop in curve "A" for the year 1911 is accounted for by a reduction of 25 per cent in locomotive construction as compared with 1910. This drop is offset, however, by the rise in curve "B" for the same period. Last year over 25 per cent of the locomotives built weighing over 200,000 pounds had vanadium steel parts.

According to Mr. Norris, the earliest application of vanadium steel to locomotive construction was for cast steel frames, a number of such frames being put in service as early as 1907, while to-day there are over 5,000 found in railway locomotives. Failures so far as recorded have been insignificant, being less than one half per cent over all causes, and if failures due to a specially weak point in design or from wrecks or failures to other parts are eliminated, the percentage of failures from vanadium steel is less than one tenth per cent.

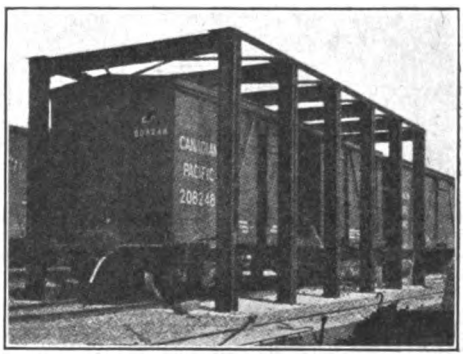
An investigation made a few years ago showed that frame failures constituted at least 20 per cent of the cost of locomotive maintenance. The use of vanadium steel frames, therefore, means a very substantial lowering in maintenance costs, and increase in earnings. Consider the record of vanadium steel frames on three roads that are extensive users, having a total of 1,500 frames in service last May. These roads are the Delaware, Lackawanna and Western, the New York Central and Hudson River and the Southern Railway. The total failures from all causes were nine, and of these six occurred on the Delaware, Lackawanna and Western on a group of eight ten-wheel passenger locomotives, and were due to an admittedly weak point in the design. A slight change in the design was made on the next lot of locomotives of this type and no further failures occurred. Since 1908 practically 80 per cent of the new locomotives on the Delaware, Lackawanna and Western have been equipped with vanadium frames, and in addition many of the old engines have also been equipped.

The experience of the New York Central and Hudson River Railroad has been even more satisfactory as no vanadium steel frames have failed. A bar of vanadium frames was applied to a lot of heavy Pacific type passenger locomotives built in 1908, the others being equipped with the regular carbon cast steel frames. Failures of the carbon cast steel frames began within two years and up to March of this year there has been 35 failures. As the result the New York Central has made vanadium cast steel frames standard equipment for road locomotives.

A Steel Car Straightener Employed by the Canadian Pacific.

IN service the freight cars of steel construction often suffer distortion without serious injury to the material other than the necessity of bending it back into shape. One of the most frequently encountered difficulties with steel equipment in a wreck is that either the sills or the frame become sprung. To make speedy repairs of damages of this characer, the Canadian Pacific Railway has adopted the device shown in the accompanying illustration. The frame shown is in use in the West Toronto shops, and is similar in design, but somewhat larger, than the original one of this type built at the company's Hochelaga Montreal, shops.

The frame comprises a double row of steel columns at 14 feet centres, there being six pairs 7 feet apart. The columns are built up of two 12 by 3-inch channels, 3½ inches apart, back to back. Riveted to each channel web, there is 6 by 3-inch I beam stiffening the column in both directions. These columns are mounted in a concrete base, 17



THE FRAME EMPLOYED BY THE CANADIAN PACIFIC FOR STRAIGHTENING BENT STEEL CARS.

feet wide, and the columns are tied together and diagonally braced at the top. In each column, between the channel backs, there is a cast iron block 8 inches deep, on each side,, the pair being tied together by two ¾-inch bolts. Passing through the pair of blocks is a 2½-inch square thread screw, 24 inches long, with a pitch of two threads per inch. The inner end of the screws have bearing plates for bearing up against any part of the car, and the outer end is squared for a wrench. By means of the ¾-inch tying bolts, the jack screws may be located in position on the column, so that the sills or any part of the frame may be pressed back into position. In cases where the screws are not sufficiently powerful to press the frame back into shape, the practice is to use a jack between the frame column and the member of the car that is to be straightened.

Not only are the members of steel cars twisted

Digitized by Google

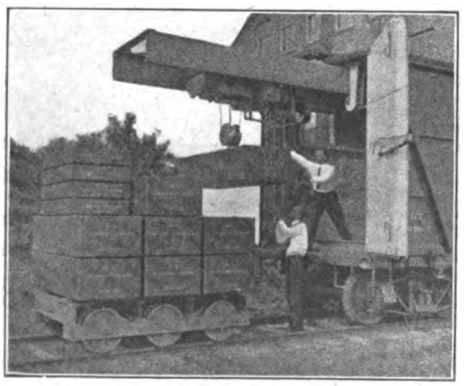
side ways, but it frequently happens that, from an end thrust, the sills are sprung upwards in the centre. To meet this difficulty, provision is made in this straightening frame. Between the end pair of columns, bedded in the concrete base, there are at each end four 1¼-inch eye bolts, spaced 1 foot each side of the rails. In each eye bolt there is a 10-inch ring. To straighten a sill, it is the practice to tie the car down to these rings by passing a chain from the rings over the body bolster or the middle section of the sills. Then, by placing a jack under the ends of the car and jacking up, it is usually possible to bend the sills back.

Scales-Testing Car of the Bureau of Standards.

THE *Engineering Record* for October 25th contains an interesting article by A. H. Emory, Jr., on the scale tesing car of the Bureau of Standards. The equipment of this car was constructed by Mr. Emory, which, as he briefly states, consists of a large number of standard weights and an apparatus for putting these weights out on the track scale as shown in the accompanying illustration.

A crane bridge which can be projected out of one end of the car is equipped with a trolley and hoist. The car carries a motor-driven truck, 90,000 pounds of large standard weights, and 10,000 pounds of weights in 50-pound standards. The crane bridge, trolley hoist, and the truck are all operated from a gasoline motor and electric generator set carried in the car.

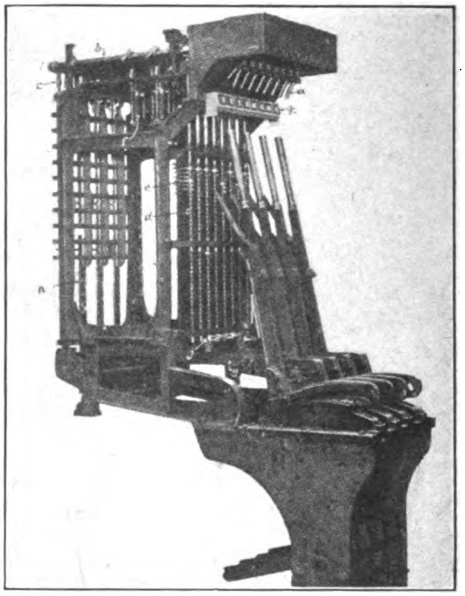
In use the car is placed with the open end near the scale to be tested, the crane bridge is projected, and the truck is lifted out of the car, placed on the rails, run on the scale, scal ereadings are taken, and the truck is run back under the crane.



REAR END OF THE SCALE TESTING CAR OF THE BUREAU OF STANDARDS, SHOWING THE WEIGHTS AND THE UNLOADING DEVICE EMPLOYED.

Electro-Mechanical Locking Frame.

THE Union Switch and Signal Company, of Swissville, Pa., has recently constructed an electro-mechanical locking frame as shown by the accompanying illustration. The electric levers *a* actuate the square shafts *b*, which by means of arms clamped to their ends work the vertical interlocking rods *c*, and also by means of bevel gear rotate the rollers *d*, carrying contact pieces, through which and the contacts



AN ELECTRO-MECHANICAL LOCKING FRAME IN WHICH THE CONTACT ROLLERS ARE DIVIDED INTO UPPER AND LOWER HALVES.

e the current is sent to the signals. The return indication comes in at *f* and automatically completes the stroke of the lever. To the mechanical levers are attached rods *g*, which raise and lower the locking rods *h*, whereby the mechanical levers are interlocked between themselves and with the electric levers.

A feature of this frame is that the contact rollers are divided into upper and lower halves, which can be operated singly or together, or, by means of the link *j*, two contact rollers or halves of adjacent rollers can be worked together in case there is not enough room on one roller for all the contacts required.

Below the electric levers, at *k*, are indication lamps for showing the state of track-circuit sections, signals, etc.

The Apprentice-School of the Chicago Great Western.

THE introduction of the apprentice-school in the Chicago Great Western Railroad shops has replaced the old method which had existed for years and is a means whereby the shop forces are recruited with first class skilled mechanics who have been under a regular instructor on the shop floor and in the shop school during the four years of their apprenticeship.

The rate of pay is based on a graduate scale of wages, advancement being made to the next higher rate at the expiration of each year's service. The apprentice on entering the different trades is supposed to have a common school education and is required to pass an examination which consists principally of problems in mathematics. The school room instructions include mathematics, general shop practice and mechanical drawing, the latter enabling the apprentice to make sketches of the different parts of the locomotive and to readily and correctly read the

Digitized by Google

BOYS AT WORK IN THE GREAT WESTERN'S APPRENTICE SCHOOL AT OELWEIN.

dimensions on drawings which are used to a considerable extent in the shop on all classes of work.

The order of instruction in the use of machine tools is standard and adapted to local conditions, the boy being taught how to operate the different machines, they are also taught how to assemble a locomotive. In addition to this the student is allowed three months' experience in the mechanical engineer's office which gives him a broader view on railroad work along mechanical lines.

The apprentice who is attentive and grasps the situation so as to get the benefit of instructions and full opportunity given him by access to the school, has a good advantage over one who has learned his trade in the shops and has to pick up what he can from observation and fellow workmen.

There is no question but what an apprentice in the Chicago Great Western Railroad shops at Oelwein has as good opportunity to learn every detail connected with the various trades as is to be found in any of the railroad shops.

There is at the present time an enrollment of 45 apprentices of the various trades and each apprentice after completing his course satisfactorily is presented with a certificate signed by the proper officials of the company, which serves as a valuable recommendation anywhere.

The apprentices are divided into classes of eight each and there is one session held each working day.

Railroad Coach Lighting.

ACCORDING to the *Electrical World* the extensive and carefully conducted tests on day-coach lighting made during the past summer under the auspices of the committee on illumination of the Association of Railway Electrical Engineeers and reported at that Association's recent convention confirm previous results of tests on the lighting of various interiors and afford a striking commentary on the inefficiency of certain very common methods of steam railway car lighting as compared to the efficiency of other methods which are better in appearance and more comfortable to the passengers. With test results reduced to an equal basis of 66.6 lumens per running foot of car, there was a difference between the systems tested ranging from 2.42 foot-candles for the most efficient translucent reflector equipment down to 1.03 foot-candles for the least efficient of the lamp equipments tested.

It is gratifying to know that the bare lamp which obtrudes itself so atrociously in the vision of passengers on many cars is next to the bottom of the list in efficiency. Since it is both inefficient and uncomfortable, railway managements can no longer have excuse for continuing its existence. The standard square diffusing shade regularly used in sleeping cars also makes a very poor showing with only 1.35 foot-candles. This equipment has always afforded a striking example of lack of attention to illuminating engineering with consequent loss of money to the operating company and a loss of illumination for the use of the passengers in such cars. Clear prismatic reflectors head the list at 2.42 foot-candles, with heavy density opal reflectors a close second at 2.14 foot-candles. The latter, on account of their ease of cleaning when of proper design, should find extensive use in railway car lighting. As might be expected, the highest efficiency was always obtained with bowl-shaped reflectors open at the bottom. All attempts to close the bottom of such reflectors with diffusing bowls have been unsatisfactory on account of the decided loss of efficiency.

The tests show that there is no practical difference in the measured illumination obtained with the center-deck and side-deck systems of lighting. In the center-deck system the lamps are placed in a single line along the center of the car. In the side-deck system one row of lamps is placed over each row of seats. However, the center-deck system has important advantages in lower cost of lamp renewals and cleaning and the use of larger and more efficient lamps. To avoid bad shadow effects it is found that lamps must be spaced opposite every two pairs of seats with either system where direct lighting is employed. With indirect or semi-indirect lighting, which, of course, is applicable to only the center-deck system, the spacing can be every three seats. It is interesting to note that both these latter systems in the tests gave higher efficiency than did the bare lamp. Thus, the most comfortable system for the eye under these specific conditions consumes less electricity than the most uncomfortable system.

Electrical

The Future of Steam Railway Electrification.

ON November 11th, Mr. G. Percy Cole, electrical engineer of the Canadian General Electric Company of Toronto, Ont., addressed the members of the Canadian Railway Club, on the conservation of natural resources through the electrification of railways. Of particular interest are Mr. Cole's conclusions that there will be no general electrification of American railways except by a process of comparatively slow development. On this particular point he said:

"In America, there is no evidence that the heads of our steam roads are contemplating any general electrification in the near future; for it is obvious that in these days of railroad regulation and difficult railway finance, unless we have a definite answer to the question, 'Will it pay?' very little progress can be made. But it is right at this point, however, that it is necessary to consider the subject in its very broad-

Digitized by Google

est aspects. In no line of human endeavor is there such building for the future as in railroading. Otherwise we would not be witnessing the present increased activity in the application of the electric locomotive to steam railway properties. If in the past, the electric locomotive has made inroads into the steam field, in connection with tunnels, terminals and mountain grades, it has been because it was the logical machine to adopt. The saving may not be apparent in lower operating costs, but may result from greatly increased capacity, the elimination of water stations along the line, the reduced steaming capacity of the steam locomotive in very cold weather, just at the time it requires its maximum power, the increased speed of trains over single track mountain divisions, the improvement in conditions of travel due to the elimination of all smoke, the many incidental advantages in having electric power available at all points of the system, and in many other different ways that will suggest themselves to the seasoned railroad man. The point it is desired to bring out here, is that the interest in the electrification of railways is fully justified, and that each case should be considered on its merits. For many years to come, for trunk line service, the steam locomotive will be used; but in building for the future, it will be wise to thoroughly investigate electric operation. We all know that in years gone by, many trolley lines have been built much in advance of their commercial justification; but the result has been a tremendous aid to the rapid extension and development of the communities served by these lines.

"Leaving aside the economic feaure, there are several important reasons why we have not seen electric operation more generally adopted on steam lines. In the writer's opinion, the foremost reason is the fact that in the modern steam locomotive we have a mighty good thing. On the whole, it is very reliable, and in what business is greater reliability required than in railroading? Everyone knows it is pretty nearly as difficult to change a Canon of the Church as to introduce some new feature on railroad rolling stock. The attitude is reasonable, and natural, as the responsibilities involved in any radical change are very great indeed.

"Another reason is the fact that for the last few years there has been a discussion going on in the various Engineering Societies as to the best system to use; leading outsiders to believe that there has been a much greater lack of agreement in regard to systems and standards than is really the case. However, as the economic range of application of each system is becoming better known we are now emerging from the chaos of five years ago to a clearer understanding of the relative merits of each system. The actual operating results from existing terminal installations has been a large factor in clearing up debatable points."

Electric Locomotive in Freight Service.

THE Omaha, Lincoln and Beatrice Railway received during the month of March, 1912, a 26½-ton Baldwin-Westinghouse electric locomotive equipped with four Westinghouse No. 101-K, 35 H. P., 500-volt, non-commutating-pole railway motors and HL unit switch control. Shortly after this locomotive was placed in service it was ballasted up to 31½ tons. The ballast was made up in the usual form of long castings bolted to the underframe into the pocket provided for this purpose in the construction of the locomotive. Beside the motor and control equipment, there are pneumatic sanders, engine bell ringer, and Westinghouse A. M. M. brakes with emergency features and in addition four-rail carrying hooks, two on each side with a capacity of three rails each. This allows for the carrying of both a small amount of rails and ties, to take care of the light repair work, and heavy repair work material can be carried on the work train hauled by the locomotive. By this arrangement the chances of tying up expensive equipments while loading and unloading were eliminated. That is no passenger rolling stock used to haul the work train as is often the case on some roads, and the locomotive can proceed with the hauling of the other freight cars while the flat car is being loaded or unloaded with material or freight.

This locomotive performs on the average of about six hours of work per day in switching and in handling freight. During the construction season the locomotive works approximately eight to ten hours per day, and up to the present time there have been no repairs needed on the locomotive and it has seen over one year of service.

The management of the Omaha, Lincoln & Beatrice Railway Company have used this locomotive in an advertising manner. For, in view of the fact that the locomotive was ready to

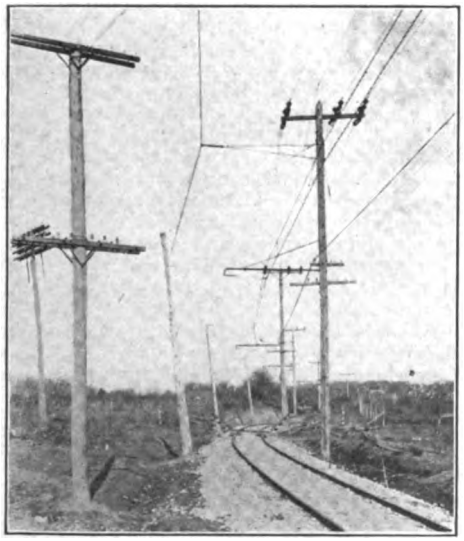
TYPICAL ROTARY CONVERTER SUBSTATION.

Over the pole line of the Union Depot Bridge and Terminal Company, the power is transmitted from the power house to the railway company's transformer station located in North Kansas City at the junction of the two divisions of the road. The 6600-volt current is stepped up to 33,000 volts at this point and delivered to the Kansas City, Clay County and St. Joseph Railway Company's transmission lines.

TRANSFORMER STATION.

Thoroughly fire-proof construction is used throughout the transformer station thus making it possible to secure a low rate of insurance. The station is 36 feet square over all and is two stories high. The first story is divided into a dispatcher's office, trainmen's room, toilet and bath room for the trainmen. Also, transformer compartments, while the second story is given up to the switch room. The walls of the building are of No. 1 kiln-run hard common brick, supported on a concrete foundation, the bricks being laid with American bond with six stretchers between the header course. The walls are capped with tile coping. Steel doors are used for all openings.

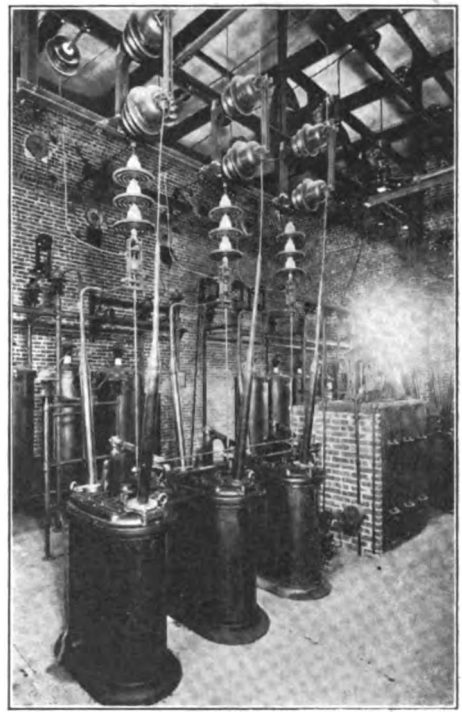


VIEW SHOWING CATENARY LINE CONSTRUCTION.

The floor of the first story of the transformer station is of concrete, 4 inches in thickness, laid on a foundation of 6-inch broken stone well rammed into place, with the exception of the floor in the transformer compartments, which is 6 inches in thickness, carried on a 9-inch broken stone foundation. The heavier floor at this point is necessary to support the transformers.

The floors in the second story are of the ferrolithic type of flat construction, the reinforcement being unpainted No. 4 gage with one-half-inch corrugation. The roof is also of the ferrolithic type, the reinforcement being No. 24 gage with one-half-inch corrugations, and is water-proofed with a five-ply tar and gravel roofing.

The design of this transformer station includes a very interesting feature—the transformer compartments. Each of these compartments measures 9 feet by 10 feet with a height equal to that of the first floor and are divided from one another



HIGH TENSION SWITCH ROOM OF THE TRANSFORMER SUBSTATION.

and the remainder of the building by fireproof walls that have no openings. Entrance to each compartment is through an 8-foot by 11-foot steel door opening from the outside of the building. Ventilation for each compartment is secured by a hinged ventilator and by metal framed windows with gratings at the top of each compartment.

The main electrical equipment of this transformer station consists of three Westinghouse 750-kva., oil-insulated, self-cooled, single-phase, 25 cycle, 6600 to 33000-volt transformers with necessary switchboards and switching apparatus. Also a Westinghouse 5 kva., type SK, single-phase, 25 cycle, 6600-220-110-volt transformer supplies the 110-volt power for lighting the transformer station and the shops, and the 220-volt current for the shop machinery.

ROTARY CONVERTER SUBSTATION SHOWING TWO 500 KW., 1200 V., D. C., 25-CYCLE, COMMUTATING-POLE ROTARY CONVERTERS.

The switchboard is composed of one panel in two sections, mounted on an angle-iron frame and located on the ground floor in the dispatcher's office.

SUBSTATIONS.

There are three substations on this system for converting the high-tension 33000-volt, 25-cycle, alternating current to 1200-volt direct current, one on the Excelsior Springs division and two on the St. Joseph division as shown in the accompanying map. The construction of the substation buildings is very similar to that of the transformer station. These buildings have a ground plan 43 feet 6 inches by 41 feet and are divided into two divisions, by a brick fire wall, whose openings are protected by steel doors. In the larger of these compartments are installed the transformers, electrolytic lightning arresters and auxiliary apparatus, while the rotaries and switchboards are installed in the smaller compartment. The substations are all one-story buildings.

EQUIPMENT.

The main equipment of each substation consists of two Westinghouse 500 kw., 1200-volt, 750 r.p.m. self-starting from A. C. side, commutating-pole rotary converters These rotaries are insulated for and can be operated at 1500 volts. This high-speed instead of 500 r.p.m. was chosen because somewhat better efficiencies are obtainable at all loads and a more stable commutation at heavy overloads. With a six-pole rotary converter operating at 500 r.p.m. it is not possible to place the brushes as advantageously as with the four-pole rotaries at higher speed. The space between the poles on the 750 r.p.m. four-pole rotaries is greater and allows for a more advantageous armature winding for the high-voltage than can be obtained on a 500 r.p.m. rotary. This is due to the fact that a greater number of commutator bars can be employed with a correspondingly average reduced potential difference between bars, thus permitting a more advantageous use of commutating poles. Heavier overloads can also be carried by four-pole rotaries due to the more advantageous proportioning of the machine, so that overloads up to 200 per cent of the rated capacity of the machine, or three times the full load current of 416 amperes, for swinging periods of twenty seconds without undue heating or injurious sparking could be guaranteed.

In each substation there is a switchboard composed of black marble mounted on angle-iron frames and consists of six panels—two rotary, two feeder and two negative bus banels.

The high-tension buses are run in in iron pipe mounted on insulated pipe-frame brackets. Two banks consisting of three Westinghouse 185 kva. O. I. S. C., single-phase, 25-cycle, 33000-to 730 volt transformers are installed in each substation. Auxiliary substation equipments in the transformer compartment includes Westinghouse type A electrolytic lightning arresters complete with horn gap disconnecting and charging device for use on 33000-volt circuit with underground neutral; type D choke coils, 35000-volts, type M disconnecting switches, 44000-volts; type GA oil circuit breakers, three-pole, single throw, hand operated, with distant mechanical control and 44000-volt overload automatic inverse time limit relays.

OVERHEAD CONSTRUCTION.

The trolley-wire, three-phase transmission line, one telephone circuit and the feeder cable are all carried on by one pole line, and also, space is allowed on the cross arms for signal wires. The design of the overhead construction is such that the road may ultimately be operated at 1500 volts

Digitized by Google

D. C. with 1200 volts D. C. for initial operation. In general five-point catenary bracket construction is used, span construction being employed only on long overhead viaducts and bridges, also for short distances in cities. Westinghouse flexible catenary hangers and curve pull-offs are used.

OPERATION.

The rolling stock consists of 27 cars. A forty-five minute headway is maintained on the Excelsior Springs division and a seventy-minute headway on the St. Joseph division. Trains are usually composed of one car and on some occasions two-car trains are operated. No. 0000 B and S gage, hard-drawn standard grooved copper wire having a tensile strength of 46,500 pounds per square inch is used for the trolley.

New Interurban Line for Southern Texas.

THE Southern Traction Company of Dallas, Texas, opened its new 150-mile interurban line between Dallas and Waco and between Dallas and Corsicana on September

PART OF EIGHT TWO-CAR TRAINS ON THE NEW ELECTRIC LINE OPERATING BETWEEN WACO AND DALLAS, TEXAS.

30th. Hourly service is now maintained between Waco and Dallas and between Corsicana and Dallas. Both local and limited service is maintained. The schedule between Dallas and Waco of 97 miles is four hours by limited train. The equipment consists of twenty-two motor cars of semi-steel construction with a seating capacity for 56 passengers each. The track is laid of 80-pound A. S. C. E. rail. Six substations are employed, the power being supplied by the Texas Power and Light Company's plant at Fort Worth.

The First Diesel Locomotive.

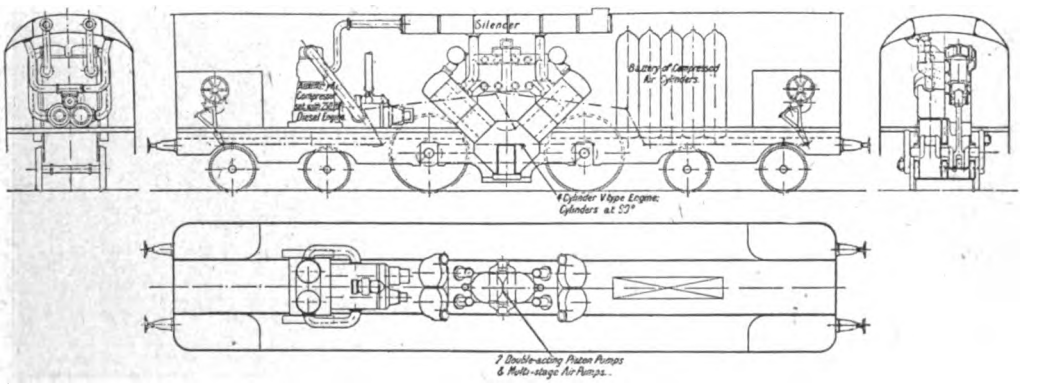
THE Central Railway Department of the Prussian-Hessian Railway, of Berlin, has recently received a locomotive operated by the Diesel oil engine. Dr. Rudolph Diesel, the inventor of these engines, a short time ago, it will be remembered, mysteriously disappeared from an English Channel steamer and his body was later recovered at the mouth of the River Scheldt. It is to be regretted that he could not have lived long enough to have seen the final triumph of his ingenius motor by its adaption to railway traction on a large scale.

The Diesel engine is an internal-combustion motor like, in a sense, the ordinary gasoline engine of the automobile, but unlike it in that it has no explosion motor. The vaporized fuel is not ignited suddenly in the cylinder by an electric spark but is consumed more gradually under the heat generated by air compression.

At first it was thought to be adaptable only to small forms of standard engines, but by constant development it has now reached a point where it can be used either on land or at sea for the propulsion of railway trains and ocean vessels. The following diagram shows the general arrangement of the locomotive recently purchased by the Prussian-Hessian State Railways.

A New Californian Electric Interurban Railway.

THE completion of the Oakland, Antiock and Eastern Railway gives California a new and strictly modern interurban electric railway between Oakland and Sacramento. The traffic which the road will develop, will receive a service about equal to that of a standard steel railroad, the equipment being heavy and built for high speed. The road opened on September 3rd, and the express schedule which is being maintained between these two cities is three hours and fifteen minutes for a distance of 93 miles, an average of 28.6 miles per hour, including the passage by ferry across Sacramento Bay. There is a section of heavy grade just east of Oakland, thirteen miles in length



Silencer
6 Cylinders of Compressed Air Cylinders
4 Cylinder Vape Engine; Cylinders at 90°
7 Double-acting Piston Pumps & Multi-stage Air Pumps.

General Arrangement of the Sulzer-Diesel Locomotive.

Digitized by Google

where the running time is only about 25 miles per hour, but on the 20 mile level near Sacramento, the speed reaches from 50 to 60 miles per hour.

The track is laid with 70-lb. titanium steel rails, and an approved automatic block signal system is installed. In the heart of the city of Oakland the road has a well-equipped freight and passenger terminal. The rolling equipment consists of steel day coaches and parlor-buffet observation cars, all fitted with multiple unit control of operation in trains. The foregoing are motor cars, but a few trailers are also provided. The accompanying illustration shows the type of electric locomotive employed in the freight service, utilizing also in that connection standard steam railroad freight cars. One division of the road, in the Morangua Valley, has been in operation for about a year, and a considerable freight business has developed there.

AN ELECTRIC FREIGHT LOCOMOTIVE ON THE OAKLAND, ANTIOCK AND EASTERN RAILWAY.

The overhead work consists of the familiar type of catenary suspension. Direct current at 1200 volts pressure is supplied in the trolley wire. The power comes from previously-operating hydro-electric power stations in the vicinity.

Terminal Improvements

New Spokane Station.

THE following perspective view of the new Spokane (Washington) station being built by the Oregon-Washington Railway and Navigation Company, gives some idea of the attractiveness and magnitude of this improvement which involves, including the freight as well as the passenger terminals, an expenditure of approximately $3,000,000 in addition to the $4,000,000 already spent for right-of-way. The passenger station is, of course, the feature of greatest general interest and is being built jointly with the Chicago, Milwaukee and St. Paul. When completed it will occupy an entire block, its dimensions being 300 feet long by 58 feet wide and four stories high. The building alone will cost well over half a million dollars and will compare favorably with most modern railway stations. The French renaissance type of architecture is being employed and the main building will be of burlap brick in pleasing design with the entire front of the first story of cream colored stone having a granite base surmounted with pilasters in front of the main waiting room and supporting a heavy stone cornice.

Four large entrance ways surmounted by a large ornamental copper glass-covered marquise provide access from Trent avenue to the large ticket and entrance lobby 168 feet long and 33 feet wide, with richly colored faience tile walls and mosaic floor. In the center of this room will be located the railroad and sleeping car ticket offices with telegraph and public telephones on each side. A direct entrance to the parcel and baggage checking counters will be immediately adjacent to the ticket office.

A passageway also leads from directly in front of the baggage and parcel checking counters to the street, and to carriages and hotel buses. The dining and lunch room is located at one end of the ticket concourse. At the opposite end is a barber shop with a stairway and elevator to the offices above.

NEW SPOKANE, WASH., PASSENGER STATION.

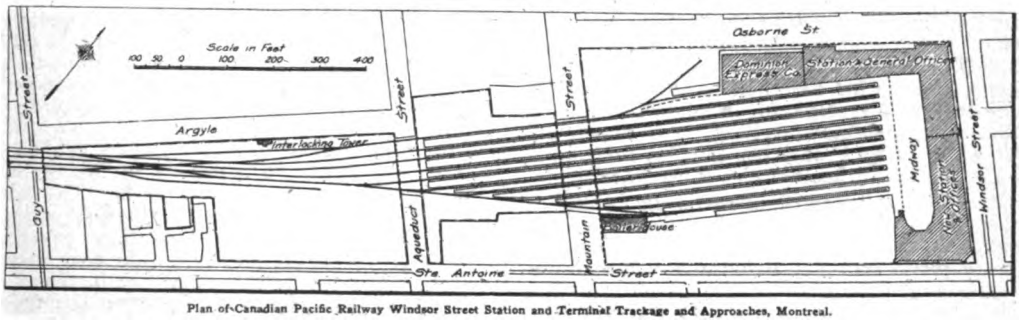
Canadian Pacific Terminal Improvements at Montreal.

THE "Canadian Railway and Marine World" for November contains an account of the remodeling and expansion of the Canadian Pacific Windsor Street Station at Montreal, which is now nearing completion. The trackage arrangements have been completed, the layout at present in use being shown in the accompanying plan of the station and terminal. All the portion of the station and office building south of the division line shown is new. The ground floor is being used for waiting rooms, restaurant, etc., and the other floors for general and local officials' offices. In the old layout, all the portion of the property south of the division line, through the new and old parts of the station, did not belong to the railway, so that all the terminal facilities were to the north of this line. In the former arrangement, there were six station tracks, all projecting into the station building about 40 feet further than in the new arrangement, the latter giving greater concourse accommodation. All the station tracks branched off from the main line just west of Aqueduct Street, with none of the station tracks of a greater length than 900 feet.

In the arrangement shown in the plan, and now in use, the number of tracks has been increased from six to eleven, and their length increased by the acquisition of the property to the south of the old tracks in the station, and the property to the north of the tracks west of Aqueduct Street. The northerly of the station tracks has been straightened out to give a clear length of 1,400 feet at the point where it strikes the main line. With one lead track leading into all the station tracks, the tracks vary from the maximum mentioned down to about 400 feet, giving a total station capacity, making due allowance for locomotive length, of 120 cars, varying in train length from five to fourteen cars.



Plan of Canadian Pacific Railway Windsor Street Station and Terminal Trackage and Approaches, Montreal.

Increasing the Grain Storage Capacity of the Chicago Great Western.

AT Kansas City, the Chicago Great Western has recently built a re-inforced concrete addition to its Kansas City grain elevator. The original structure built in 1905, consists of fourteen steel and tile cylinder storage tanks. The additional construction consists of twelve cylinder tanks each 27 feet 8 inches in diameter and 86 feet high. The addition pro-

Digitized by Google

vides storage for 513,300 bushels which, with the original elevator, gives a total storage capacity of nearly a million bushels or about 1,000 carloads. The accompanying photograph shows the elevator enlarged by the construction of the additional concrete tanks.

Interstate Commerce Commission

New Position for Commissioner Prouty.

AN important recent development has been the public announcement that Charles A. Prouty, the New England member of the Commission, will resign from that body to become director of the Bureau of Physical Valuation of the Commission. While the new position from a salary point of view, is a more lucrative one, it is understood that this has no influence upon Mr. Prouty, who, before the recent developments in connection with the Bureau of Physical Valuation, had already expressed his intention of resigning from the Commission at the end of his seven year term in December, 1914. Later in the month, there developed some doubt as to whether President Wilson would deem it advisable for Mr. Prouty to leave the Commission as his rare ability and long experience make his services of unusual value to that body. At the present writing, it is understood that while Judge Prouty has sent his resignation to Mr. Wilson, it has not as yet been accepted.

Should it be accepted, there is also likely to be another vacancy in the Commission on December 1st, as on that date, Judson C. Clements' term expires and it is generally believed that another will be appointed in his place. This would leave two vacancies for President Wilson to fill and there has been considerable speculation as to his probable selection. Among those who have been prominently mentioned for these positions are Martin S. Decker and Milo R. Maltbie, of the New York Public Service Commission; D. O. Ives, chairman of the Transportation Committee, of the Boston Chamber of Commerce; Patrick J. Farrell, solicitor of the Commission and ex-Governor Glenn, of North Carolina.

It is hoped and believed in making these appointments, if indeed the President decides not to reappoint Commissioner Clements, that they will be of such a character as will tend to further divorce railway regulation from the influence of politics. Perhaps the most essential qualification for a position of this character, is a judicial mind, although administrative faculties are also highly desirable. The time is rapidly approaching when railway problems must be approached from the standpoint of absolute impartiality, if the public is to be really served to the best advantage and only a highly judicial mind contains the fundamental qualities necessary for such an attitude.

While considerable activity is noted in political quarters, for the purpose of having one or more of their numbers appointed to the Commission, it is believed that President Wilson will consider eligible only those men who have had a thorough and practical experience in railway operation or regulation. The situation to-day demands the appointment of such men and no greater harm could befall the proper development of railway regulation than the appointment to these high positions of men whose only qualifications are their political pull or prominence.

Commissioner Clark's Significant Statement.

CONSIDERABLE space is given in another section of this issue to the Convention of the National Association of Railway Commissioners held at Washington, the latter part of October. Perhaps the development which created the most interest in the public mind was the opening address delivered by Chairman E. E. Clark, of the Interstate Commerce Commission, whose remarks were widely interpreted by the daily press as meaning that proper transportation conditions could not be obtained without an increase in rates. While Mr. Clark did not really make this statement and in fact, could not properly have made it, there is surely much of encouragement in what he did say, which was in part as follows:

"An ideal transportation situation can be attained only by large additions to the facilities and great improvement in methods. The added facilities can be secured only through expenditures from surplus earnings or from expansion of credit. In either way the total cost to purchasers of transportation would be increased.

"Even if it be true that the present financial condition of transportation agencies is due to reckless, improvident or even dishonest financing in the past, it would be a mistake to undertake to correct it by a policy of reprisal, which would impair the usefulness or efficiency of the carriers upon which the welfare—the very life—of the commerce, of the country depends. It seems to me that the traveling public is justly entitled to a greater degree of safety while patronizing our railroads. The importance of this should be brought forcefully to the mind of every railroad official and every railroad employe. They should be held to strict accountability for neglect. It would be well to revive and enforce the old fundamental rule for train operation, 'In case of doubt, take the safe side.'"

Commissioner Meyer on Cost Accounting.

AT the recent annual convention of the National Association of Railway Commissioners, Commissioner Meyer, of the Interstate Commerce Commission, delivered a report which reflected to a limited extent his work with the Federal Commission in attempting to arrive at a system of expense sheets for the railroads whereby the cost of each individual service could be estimated as a base for fixing reasonable rates.

He said in part:

"In justice to the opponents of cost accounting, it should be understood that most of the roads which separate their expenses between freight and passenger traffic do so as a measure of efficiency in operating and not for measuring the reasonableness of the rates.

Digitized by Google

"There is great need for standardizing the practice to which reference has been made. The most common rule for separating common expenses is that of train miles, but other bases are also used, such as locomotive mileage, car mileage, etc. There is also need for standardizing the practice with respect of those items which are regarded as directly assignable, for it is apparent from these reports that some roads make these assignments with much greater thoroughness than other roads.

"Generally speaking, it may be said that when the accounting has been suitably planned at least two-thirds, and perhaps more, of the operating expenses can be separated either directly or on reasonably convincing basis of apportionment. The percentage obviously depends in part on the nature of the traffic. An all-freight road can apportion 100 per cent of its expenses to freight. The Erie entered 73.3 per cent of its operating expenses in columns calling for expenses caused by either service alone. For the Pennsylvania lines west the corresponding figure was 72.2 per cent.

"Theoretical opinion is showing some tendency to be more favorable to the cost of service principle, and the argument for a system of cost accounting is strengthened by a consideration of the nature of the questions with which regulating bodies have to deal. To be called upon to say, not only what railroads as a whole should be allowed to earn, but more particularly what the freight business shall earn as against the passenger business, or the express business, or the mail business, is to be confronted by questions which admit of no final answer except the answer of cost.

"Railroad representatives have appeared time and again before committees of Congress, before courts and before commissions with cost estimates trying to convince these bodies that this or that rate was too low or not too high. It may be argued that these cost estimates are made at the request of lawyers, and what lawyers do is what lawyers think the courts require.

"Up to the present time the courts have not shown any inclination to discontinue considering cost as an important factor in the ultimate determination of a rate.

"We believe that if cost of service is to continue to be the determining factor in measuring the reasonableness of rates it is time that the division of expenses among the several branches of the service should be threshed out to a finality. In some manner the combined wisdom of engineers, accountants, statisticians, economists, operating officials and representatives of commissions should be concentrated upon this problem with the hope of establishing authoritative rules for the division of expenses."

Organization Notes

Effective Work of the Bureau of Railway Economics.

AT a meeting of the Bureau of Railway Economics, held in Washington, on October 17th, the work of the organization since its inauguration was reviewed, and according to a statement issued by L. G. McPherson, director of the bureau, "speeches commending the impartiality and thoroughness of its analysis of transportation questions and emphasizing the necessity for the continuance of such work, were made by Samuel Rea, president of the Pennsylvania Railroad; W. C. Brown, president of the New York Central; W. W. Finley, president of the Southern Railway; L. E. Johnson, president of the Norfolk and Western; E. P. Ripley, president of the Atchison, Topeka and Santa Fe; Ralph Peters, president of the Long Island Railroad; Frank Trumbull, chairman of the Chesapeake and Ohio and Missouri, Kansas and Texas railways; Frederick A. Delano, president of the Wabash Railroad; C. S. Sims, vice-president of the Delaware and Hudson Company and others. A general executive committee for the ensuing year was elected, consisting of Samuel Rea, chairman; L. E. Johnson, Daniel Willard, Darius Miller, Fairfax Harrison and B. L. Winchell.

Outing of the Pittsburgh Railway Club.

ON September 26th, the members of the Railway Club of Pittsburgh, their ladies and their friends, were the guests of the Westinghouse Air Brake Company at Wilmerding, for a day of outing and entertainment. The program included a trip through the various buildings and shops of this great company and terminated with a dinner served in the Welfare Building to the accompaniment of good music by the Westinghouse orchestra. In the evening the guests were addressed by Mr. A. L. Humphrey, vice-president and general manager of the Westinghouse Air Brake Company, who described in an interesting manner, how the company had built and provided for the inhabitance of the community, a total of 321 substantial homes. In addition to the homes the company has also provided buildings which have been dedicated to the physical, intellectual and social welfare of the district. The streets of the town are paved and provided with perfect sewage, water and light system. It has two parks and an athletic concourse and play ground all provided by the company. Annual prizes are offered for the best kept lawns, gardens, etc. There is a federation employes' association and a relief department which pays relief benefits in case of sickness or injury, and pensions all employes who reach the age of 70 years and have been in the service of the company for 20 years or over.

Mr. Humphrey pointed out that the activities of the company were confined exclusively to the manufacture of railway specialties and asserted that in the company's plant alone had been manufactured 2,800,000 sets of brakes for freight cars, 78,400 sets of locomotive equipment and 86,300 sets of passenger equipment. Referring to the railway situation, he said:

"Notwithstanding the many discouragements, receiverships and failures encountered by the different railways constructed across the con-

MEMBERS OF THE RAILWAY CLUB OF PITTSBURGH AS GUESTS OF THE WESTINGHOUSE AIR BRAKE COMPANY.

tinent, we find people who still claim that, although our freight and passenger rates are scarcely one-half of what they are in foreign countries, the railroads are robbing the people and giving nothing in return.

"A great deal has been said and written the past few years regarding the conservation of our natural resources and the necessity of a 'Safety First' Campaign. As stated in the first part of my remarks, little is said by journalists or orators about what has been accomplished, but a great deal of fuss is being made about what should be done in the railroad and manufacturing world along the line of safety.

"I have related the advance step taken by the railroads in the introduction of the air brake, which was followed by the introduction of many other appliances equally as important, and about the only credit the railroads received after this work had been largely accomplished was the passing of laws making the use of such safety appliances compulsory.

"I know from my own observation and my long association with railroads that the foremost thought in the minds of the officers at the head of the great systems contributing so much towards the development of this country has been not only the conservation of our natural resources, but the conservation of the human race by the elimination of accidents. The development and introduction of appliances for the safety of the traveling public and the railway employes has kept far in advance of any conceived idea of the necessity for such devices by those that clamor the loudest for them after they discover they have been put in use.

"I am familiar with one case where a Company in one plant spent upwards of three-quarters of a million dollars to improve and add to the sanitary and safety conditions of their manufacturing plant, and, believing that what had been accomplished would be of interest to the general public, a certain important periodical was requested to send one of its writers for the purpose of describing the new features that had contributed so much to the comfort and safety of their employes. After spending several days in and around the plant this writer retired with such information as would have enabled him to write a most interesting article, but instead of giving what would have been of interest and value to the public and other concerns interested in similar work, when the article actually appeared there was scarcely mention made of the many features that had been introduced. The improvements had been passed over with hardly complimentary mention, but the conditions under which some of the foreigners in the neighborhood lived were extensively commented upon and the company severely criticised for allowing such a condition to exist in a community where their plant was located.

"We can only account for such action as this on the part of the social writers on the ground that they give the public what is the most popular, and so long as the public is uninformed we can expect nothing more than sensationalism on the part of those who make a living by these methods.

"It is, therefore, the duty of such organizations as The Railway Club of Pittsburgh, which stands second to none of similar organizations in the country, to give greater consideration to just such subjects, and be prepared to point with pride to what has been done by corporations that its members represent, as this Club is composed of representatives of railways and manufacturing corporations."

Convention of Railway Signal Association.

THE 18th annual convention of the Railway Signal Association was held in Nashville, Tenn., on October 14th to 16th. President B. H. Mann, signal engineer of the Missouri Pacific Railway presided. The membership was reported by the secretary as numbering 1,209. The following subjects were discussed:

"Treated ties and track circuits; switch indicators; mechanical interlocking; power interlocking; automatic blocks; manual block; subjects and definitions; standard designs; electric railways and alternating current signaling; wires

Digitized by Google

and cables; storage battery and charging equipment; recording signal performance; low-voltage switch-operating mechanism; state of signaling in the northwest."

Organization of Railway Fire Protection Association.

THE Railway Fire Protection Association was organized in Chicago, on October 7th, with a membership of forty representing the fire protection and other insurance departments of as many railways. A constitution and by-laws were adopted, which provide that "The object of this Association shall be to promote the interest in and improve the methods of fire protection and prevention; to obtain and circulate information on these subjects, and secure the co-operation of its members in establishing proper safe-guards against loss of property and life by fire, and to standardize practices through the interchange of ideas and experiences with regard to such matters in connection with railway properties."

The action of the association is to be considered advisory and not mandatory. Any representatives of railway companies interested in fire protection and prevention are eligible to membership. The annual meeting is to be held on the first Tuesday in October, the location to be selected by the executive committee, and special meetings may be called by the president or executive committee.

Officers were elected as follows: President, F. H. Elmore, superintendent of insurance, Southern, Washington, D. C.; vice-president, P. Hevener, assistant supervisor of insurance fund, Rock Island Lines, Chicago; secretary-treasurer, C. B. Edwards, fire insurance agent, Mobile & Ohio, Mobile, Ala. Executive committee, R. H. Newbern, superintendent insurance department, Pennsylvania, Philadelphia; Col. B. W. Dunn, chief inspector Bureau for the Safe Transportation of Explosives, Inflammables, and Other Dangerous Articles, New York; B. S. Mace, superintendent of insurance, Baltimore & Ohio, Baltimore; G. G. Tunell, insurance commissioner, Atchison, Topeka & Santa Fe, Chicago; N. Searles, insurance superintendent, Southern Pacific, San Francisco, Cal.; W. S. Langford, insurance department, New York Central Lines, New York.

Convention of the Engineering Association.

THE annual convention of the Engineering Association held in Atlantic City, during October, resulted in an attendance practically equal to that at the large convention of 1911. Those in attendance included several managers and engineers from abroad and they were impressed with the scale and scope of the entire convention especially of the exhibits. The election of officers resulted as follows: President, J. H. Hanna, Washington; first vice-president, L. P. Crecelius, Cleveland; second vice-president, John Lindall, Boston; third vice-president, B. F. Wood, Altoona. Members of the Executive Committee: F. R. Phillips, Pittsburgh; Norman Litchfield, New York; H. F. Merker, East St. Louis; J. P. Barnes, Syracuse. Secretary-treasurer, E. B. Burritt.

Meeting of Transportation Club of Indianapolis.

AT the September meeting of the Transportation Club, of Indianapolis, Blewett Lee, general solicitor of the Illinois Central Railroad, delivered an address on the railway situation and its causes. Mr. Lee gave the following reasons why railways at the present time are finding it impossible to borrow sufficient funds to properly finance their obligations:

First, the increase in the price of all railway supplies; second, the steady and heavy increases in the wages of railway labor; third, the heavy cost of legislation and regulation both State and Federal; fourth, the steady progress of rate reductions; fifth, the over-taxation of railroads, and sixth, the growth of personal injury litigation and the extravagant verdicts which have been rendered against the carriers. After elaborating these various causes, Mr. Lee continued:

"Still another consideration in the rise of the rate of interest is corporate finance. Instead of borrowing at four per cent even the most fortunate corporations now, and probably for a long time in future, will have to pay at least five per cent for long time money upon the best security with rates correspondingly higher on short loans.

"What is going to be the outcome of all this? The ultimate result, I fear, is government ownership, with worse administration of the railroads than ever before, and practically no remedy or redress for its shortcomings. We will then be about as helpless about our freight as we now are about our mail. Meanwhile we can only pray:

Be near us when our goods
Are slipping o'er the brink;
We are nearer government ownership to-day
Perhaps than now we think.

"What is to be done about it? Why, there is only one thing that offers any present hope of relief, and that is a moderate but general increase of freight rates. Just as long as the relative adjustment of rates is not changed, nobody would be seriously hurt, and the railroads would be able to show the bankers such a balance sheet as would justify the necessary loans. That is the remedy that England is applying to-day, and that is wise business sense in America, too, and wise statesmanship, also, for it would be ultimately for the benefit of the whole public.

"Now, I confess that I am not very hopeful that the necessary thing will be done, for it requires an amount of moral courage on the part of public men which is painfully absent in public life. To do the presently unpopular thing for the sake of the distant and certain public good takes a certain heroic quality which is very rare. No man wants to be a martyr. What is more likely to happen is that the railroads will continue to sit tight and hold on to every dollar they can, until the pressure of the inevitable increase of business becomes so great that even at present rates they will be able to make a living. Slowly from the grinding necessities of a reluctant people at last by bitter experience will be extorted a sufficient reward to capital to induce further investments in railroad property.

Digitized by Google

The mills of God grind slowly,
But they grind exceeding small;
Tho' with patience He stands waiting,
With exactness He pays all.

"The short-sighted greed which compels carriers to work for less than a living wage, will be succeeded by the want, the pressing want, of railroad facilities with no means to get them, for nobody on earth can be compelled to send good money after bad. In the present state of affairs in this country investments in railroads are bad money, and until they are made good money by better rates and fairer legislation, the savings will not be coaxed out of eastern and European strong boxes. The ancient call of "Ducky, ducky, come up and be plucked," has somehow lost its charm, and those bond-buying savings banks have developed a wholesome fear about not getting their interest on new railroad investments. The necessity for improvements is upon us, the money is really there, but the confidence is lacking, and in all frankness it ought to be lacking until a change comes over the treatment which the state gives to its railways."

Meeting of Central Railway Club.—The November meting of the Central Railway Club was held in Buffalo on the evening of the 14th, and proved extremely interesting to those present. Mr. H. B. B. Yergason, delivered an interesting address covering the entire circle of iron ore mining, handling and shipping, including the manufacture of pig iron and some of the more interesting steel processes, all of which were illustrated with a series of moving pictures showing all the operations.

Convention of Railway Electrical Engineers' Association.—The sixth annual convention of the Association of Railway Electrical Engineers was held in Chicago from October 21st to 24th, D. J. Cartwright, electrical engineer of the Lehigh Valley, presiding. Papers were submitted under the following heads: "Head end equipment; head end axle system; locomotive headlights and dynamo suspensions."

The report of the secretary and treasurer showed a membership of 500 and a balance in the treasury of $1,146.

Richmond Railroad Club Safety First Meeting.—It is hard to find a place where the safety first movement is not reaching. Within recent months, talks have been given on this subject before a number of railway clubs and have constituted an unusual effective method by which to spread the movement. At the September meeting of the Richmond Railroad Club, Mr. J. W. Coon, assistant to the general manager of the Baltimore and Ohio Railroad, spoke on safety first and his remarks, which were of an eminently practical character, were followed with the closest attention by those present. Mr. Coon laid great stress on the point that the success of the safety movement rested upon the education of the employe and this must be accomplished in such a manner as to procure both his sympathy and co-operation. Often those employed on the train, in the yard or on the track are suspicious of a movement of this kind because they feel it contains ulterior motives which might prove detrimental to their welfare. The only way to overcome this attitude, as Mr. Coon stated, is to take the men fully into your confidence and to inform them from time to time as to the real conservation of human life which is accomplished through an adherence to the company's rules and the development of more careful methods generally in railway operations. Particular stress is laid upon the rigid enforcement of the company's rules. Without such enforcement greater safety will never become an actuality on American railways. It is often the claim of railway employes that the unvaried enforcement of all rules cause delays which make prompt train movements impossible. Mr. Coon points out that if this difficulty exists the rules should receive the necessary modification, but in no instance should they be subject to the interpretation of the individual but should be closely followed and obeyed by all employes. However, there appears only one method by which this can be accomplished and that is by the further enlightenment of the employe regarding the efficacy and necessity for such rules. In other words, education as heretofore noted, is the keynote of the greater safety movement.

Meeting of Railway Development Association.—The Railway Development Association composed of industrial, agricultural and immigration agents and others concerned with railway development work in the United States, Canada and Mexico, met at Baltimore on November 11th, 12th and 13th, more than a hundred members being present. The subjects discussed included the probable effects of the Panama Canal on the industrial situation in this country; the problem of immigration and how to get the immigrants out of the overcrowded city tenements onto the farm land, where they are greatly needed; the problem of agricultural development and transportation of agricultural products to the cities, and other problems concerning the railway business itself.

The first two days were devoted entirely to business meetings, but on the third day the visiting officials were taken on a trip of inspection over Baltimore which was followed by a trip to Washington and Mount Vernon. On the evening of the second day, a banquet was given in honor of the visiting members and the ladies of the party at the Hotel Bellvidere. Several government and railroad officials addressed the diners.

Annual Meeting of the Newark Traffic Club.—The regular monthly meeting of the Traffic Club of Newark, N. J., was held on Monday evening, November 3rd. As this was the annual meeting, a large attendance was realized and the selection of the Nominating Committee received hearty and unanimous approval of all present.

The new officers are: President, H. B. R. Potter, commercial agent of the Erie R. R.; first vice-president, Charles Vail, G. F. A., Trans-Continental Freight Company; second vice-president, Robert E. McHugh, A. T. M., Murphy Varnish Company; secretary, John J. Kautzmann, traffic manager, Goldsmith Detinning Company; assistant secretary, L. J. Wesley, T. F. A., Lehigh Valley R. R.; treasurer, W. John Creighton, C. R. C., Pennsylvania Railroad.

A. Preston Jump, Freight Agent, Carnegie Steel Company, a former president of the Club, was re-elected chairman of the Board of Governors, and associated with him will be Charles

Digitized by Google

Milbauer, T. F. A., Trans-Continental Freight Co.; John T. Rogers, T. M., Thomas A. Edison, Inc.; F. W. Smith, D. F. A., D. L. & W. R. R.; C. H. Gulick, Commercial Agent, Lehigh Valley R. R.; R. O. Von Steuben, Commercial Agent, New York Central Lines and J. W. Paterson, T. M., Balbach Smelting & Refining Company.

Mr. Potter made the following appointments for various committees: Speakers and Papers, C. C. Bacon, chairman; Reception, Abram Davis, chairman; Entertainment, David H. Litter, chairman; Membership, F. E. Stone, chairman; Publicity, E. H. W. Maxwell, chairman; Freight, F. A. Feidler, chairman; Auditing, A. Wilson, chairman, historian, Geo. J. Needham.

Western Classification Committee to Meet in January, 1914.—The next meeting of the Western Classification Committee will be held at Hotel del Monte, Monterey, Cal., commencing Tuesday, January 13, 1914. Chairman Fyfe, of the committee, announces that the docket will close on Monday, November 10, 1913, and notice is, therefore, given sufficiently in advance to enable all petitioners to have their petitions filed before that time, so that the same can be properly included and published therein.

Senator Sherman Addresses Chicago Transportation Association.—That there is no justification at the present time for hostility on the part of the public toward the railroads was the statement made by United States Senator Lawrence Y. Sherman, in an address at a luncheon given by the Chicago Transportation Association, in October. "The public will support any railroad which refuses to be dragged into politics and attends to its own business," said Senator Sherman. "I believe that the rail carriers are attending to their own business to-day and letting politics alone. Shippers should give careful consideration to the question of vesting in the National Government the power to regulate interstate rates. That problem may be presented to Congress, and at the present time, I must admit that I would not know which way to vote."

New York Traffic Club Selects Candidates.—The monthly meeting of the New York Traffic Club, on October 28th, accepted the following nominations of officers for the ensuing year who will be voted for one month hence:

President, R. H. Wallace, general passenger agent of the Erie; vice-president, W. J. L. Banham, traffic manager, Otis Elevator Co.; W. W. Hall, general agent of the St. Paul; John T. Rogers, traffic manager, the Edison Co.; W. H. Snell, general agent, passenger department, Canadian Pacific; A. J. Zock, agent, Hamburg-American Line; treasurer, F. C. Earle, New York; secretary, C. A. Swope, eastern freight agent, Louisville & Nashville; member of board for three years, J. L. Carling, traffic manager, Arbuckle Bros.; W. J. Love, assistant to the manager, International Mercantile Marine; DeWitt, Jr., eastern traffic manager, Western Electric Co.

Meeting of Central Passenger Association.—Central Passenger Association charges clergymen's reduced rates privilege is being abused for account of theological students who would not complete studies for several years applying for clergy fares. Committee has been appointed to report on advisability of abolishing all special clergy fares or establishing a uniform practice for road's guidance.

Action on the question of operating tourist cars from Chicago to nearest points deferred until next meeting. It was decided to inform applicants for low fares to conventions that no fare less than two cents a mile in each direction will be granted.

Fall Meeting of American Railway Association.—The fall meeting of the American Railway Association will be held at the Blackstone Hotel, November 19th. Reports will be presented by the Executive Committee and committees on transportation, maintenance, automatic train stops, relations between railroads and explosives.

President Wilson to Address National Rivers and Harbors Congress.—President Wilson will deliver the opening address at the National Rivers and Harbors Congress, to be held in Washington, December 4th, 5th and 6th. The recommendation of General Bixby, the retiring chief of the army engineers, in favor of the purchase by the Government, of the Chesapeake and Delaware Canal, will be the subject of addresses by Representative John H. Smell, of North Carolina, and Representative J. Hampton Moore, of Pennsylvania. Secretary of War Garrison, John D. Hazen, Minister of Marine and Fisheries of Canada; Senator Fletcher, of Florida; John Barrett, of the Pan-American Union, and a score of others will address the Congress.

Bi-Monthly Meeting of Pittsburgh Traffic Club.—The Traffic Club, of Pittsburgh, held its bi-monthly meeting and dinner at the Fort Pitt Hotel, Monday, October 13th. The affair was for members only and a full attendance was had, with Mr. E. C. Sattley, president, presiding. After the business meeting an address was made by Mr. W. J. Bogert, historian, followed by moving pictures of "The Pendleton Round-Up," portraying old customs of the far west. An excellent musical program was rendered. The Club at this meeting, decided to increase the radius from forty to sixty-five miles of Pittsburgh for the Transportation Members, which will place the railroad radius on a parity with the industrial. This will make eligible for membership railroad officials from Youngstown, Steubenville, Wheeling and Johnstown districts.

LEGISLATION.

Legislation Affecting Train and Switching Crews

THE Special Committee on Relations of Railway Operations to Legislation, have recently issued Bulletin No. 55, which contains a review of the legislation which has been enacted in twenty-one states affecting train or switching crews. An anaylsis of these laws is also presented. The Bulletin calls attention to a law which has been enacted in Arizona, limiting the number of passenger and freight trains and that in some sixteen States, laws have been passed which prescribe certain qualifications for

Digitized by Google

employes. The Bulletin has been prepared with the view of showing the gradual development of legislation on this subject and includes all the laws which have been enacted at any time regardless of whether later legislation has repealed previous laws. The analysis of such laws, however, which is also presented, contains only the provisions of acts which have not been repealed. The Bulletin should prove exceedingly valuable to all those engaged in the legal and operating departments of the railways.

Congress and the Railways.

NOTWITHSTANDING the fact that Congress has appeared busily engaged during recent months in the consideration of tariff and currency matters, a large number of bills affecting the interests of common carriers, from track equipment to rolling stock, and also extending the control of the Interstate Commerce Commission, have been introduced during the present session, and their number and variety unmistakably indicate that Congress intends to continue its activities along the lines of railway regulation.

In a recent issue, "The Nation's Business," the official organ of the Chamber of Commerce of the United States, presents a summary of these bills, the most important of which are the measures that propose to increase the powers of the Commission. There are from ten to fifteen of such bills.

As placing additional responsibilities upon railroads, possibly the fourteen bills prohibiting the transportation of certain kinds of freight would, if made law, prove the most exacting.

Seven measures affect track equipment and nine the equipment of rolling stock.

Passengers' interests are directly involved in three measures. The relations of railroads and express companies are involved in three measures.

Three measures relate to governmental supervision of capitalization.

Five relate to the transportation of live stock and the icing of cream.

Six deal with the extension of the liabilities of common carriers and certain phases of legal procedure. Three deal with rate discriminations.

Four relate to bills of lading and four to the interests of the employes of common carriers.

The most far reaching bills relative to extending the power of the Interstate Commerce Commission are S. 2515, introduced by Mr. Lewis, of Illinois, and H. R. 7213, introduced by Mr. Cullop, of Indiana. The title of the first of these is "To amend the interstate commerce law and to authorize the Interstate Commerce Commission to assume the power of supervising the issuance of stock, the issuance of bonds, the matter of consolidation, amalgamation, or combination of all transportation lines doing an interstate commerce business, and all interstate concerns engaged in any form of interstate commerce, and for such other purposes as shall protect the public against watered stock and excessive bond issues and consolidations made with the object of effecting monopoly and trust in matters of interstate commerce." The title of the second is "To regulate the purchase and leasing of railroads and the issuance of stocks and bonds by common carriers, and for other purposes."

Both of these measures would empower the Commission to approve or disapprove of the issuance of stocks and bonds by common carriers.

Both of the bills also prevent the mergers of railroads until the mergers are proved to the satisfaction of the Commission not to be detrimental to the public welfare.

Other bills introduced during the present session of interest to the railways may be briefly summarized as follows:

A bill by Mr. Peters, of Massachusetts, permitting the Interstate Commerce Commission to establish branch offices in charge of agents who may grant preliminary hearings and adjust differences on freight car demurrage, the agents' decision to be approved by the Commission.

A bill by Mr. Lafferty, of Oregon, to enlarge the jurisdiction of the Interstate Commerce Commission by giving to that body power to fix reasonable rates based upon physical valuation, to be charged by all common carriers, etc.

Two bills, one by Mr. Kenyon, of Iowa, and the second by Mr. Sims, of Tennessee, authorizing the Interstate Commerce Commission to determine a uniform freight classification.

A bill by Mr. Hardwick, of Georgia, requiring the Interstate Commerce Commission to show in its annual report all accidents and their causes and providing for a penalty to be met by railroads who delay the filing of their reports.

A bill by Mr. Hulings, of Pennsylvania, which would appropriate $50,000 to enable the Interstate Commerce Commission to investigate appliances or systems that promote the safety of railway operations.

A bill by Mr. Miller, of Minnesota, requiring that transportation, telegraph and telephone companies engaged in interstate commerce and contemplating the issuance of securities should make full reports on the purpose of same to the Interstate Commerce Commission. This bill would prohibit the issuance of securities for funded indebtedness for a longer term than fifty years or at a rate of interest higher than six per cent.

A bill by Mr. Allen, of Iowa, conferring upon the Interstate Commerce Commission the adjudication of wage differences between employes and employers of common carriers.

Three bills bearing directly upon the supervision of directorates have been introduced. One by Mr. Chilton, of West Virginia, forbids any merger that would result in monopoly and would further forbid the officers of one company from acting as officers or executives of another or controlling it through the holding of stocks or otherwise. Two bills on the same subject introduced by Mr. Stanley, of Kentucky, are aimed at preventing the directorates having as members those who are engaged in manufacturing commodities that the railroads would need.

Two features of prohibited freight are mentioned a number of times in the pending legislation of the present Congress. The first relates to the products of convict labor and the general purpose of all is to divest goods, wares and merchandise, manufactured by convicts or

Digitized by Google

by convict labor, of their interstate character, and not simply to limit but to forbid their shipment in interstate commerce.

Three bills dealing with the regulation of the products of child labor, have been introduced; one by Mr. Kenyon, of Iowa, which would prohibit interstate carriers from accepting the products or outputs of factory, mines or mills employing children under fourteen years of age. Another bill has been introduced by Mr. Cullop, of Indiana, for a similar purpose. This bill would also compel all corporations running factories, mines or mills, to file semi-annually with all carriers who handle their products, an affidavit that no children under fourteen years of age were employed.

Six measures are before Congress relative to the adoption of steel mail cars and passenger equipment. Each of these bills differ slightly in title and in detail. Three of them make it unlawful, after January 1, 1914, to run wooden passenger or mail cars between cars of steel. The bill of Mr. Roberts not only includes all steel passenger equipment but involves the adoption of safety devices, automatic switches, signals, etc., within two years. Failure to adopt such devices would in case of any accident, resulting in the death of any person, make the directors and officials of the railway company, individually liable on charge of manslaughter.

A bill of Mr. Mann would prohibit the use of any but steel railway mail cars after July 1, 1917. According to the bill introduced by Mr. Esch, of Wisconsin, the adoption of steel car equipment must be complete on January 1, 1918, and according to the bills of Mr. Talcot, of New York, and Mr. O'Gorman, of New York, upon the same date. A bill by Mr. Hughes, of West Virginia, places the date on January 1, 1915, and one by Mr. Roberts, of Massachusetts, within four years.

Mr. Mann, of Illinois, has introduced a bill to compel the railroads to adopt a block system of signaling over the entire mileage, allowing twelve years for installation and providing for semi-annual reports of progress. A bill by Mr. Esch, of Wisconsin, provides for the completion of the block system by July 1, 1917. The bill also provides that on roads where receipts from passenger traffic, express and mail have aggregated $1,500 per mile or where receipts from all traffic have aggregated $3,000 per mile for two years, the adoption of the block system should be obligatory by July 1, 1914.

A bill by Mr. Levy, of New York, would require the railroads to report to the Interstate Commerce Commission within ninety days, the system of signaling and train control in use and would require the installation of automatic train stops within twelve years, at least one-twelfth of the mileage to be completed each year.

A bill by Mr. French, of Idaho, goes so far as to compel common carriers to adopt uniform rules for the operation of railroad trains and to use a uniform system of signals.

Three headlight bills have been introduced; those by Mr. Cummins and Mr. Talcot being identical and requiring suitable headlights as determined by the Interstate Commerce Commission. A bill introduced by Mr. Raker, of California, would require common carriers to equip all locomotive engines used in interstate traffic with headlights of not less than 1,500 candle power.

A bill introduced by Mr. Sutherland would provide an exclusive remedy from accidents resulting in disability or death to employes of railroads engaged in interstate or foreign commerce.

A number of bills were introduced for the purpose of extending the scope of workmen's compensation when applied to civil employes of the United States Government. The bill introduced by Mr. Sabath, of Illinois, includes both employes of common carriers and civil employes. A number of bills of similar character have been introduced and while those that relate to the compensation for injuries received while in the employ of common carriers, differ in some details, all are aimed at an extension of the workmen's compensation idea and would generally make the burden of the compensation for injuries an element in the cost of transportation.

Several bills have been introduced relative to the hours of work for employes of common carriers. That of Mr. Kern provides for one day off in seven. That of Mr. Carey, of Wisconsin, limits employes of carriers to sixteen hours' continuous work with the exception of train dispatchers, tower and signal men, whose hours of continued employment are to be eight.

Mr. Sherwood, of Ohio, introduced a "full crew" bill which provides for a full crew on all trains operated.

A bill by Mr. Dyer, of Missouri, provides for the examination, determination and certification by the Interstate Commerce Commission as to the competency of roadmasters, foremen and other employes of common carriers.

Six measure appear under the classification of liability and legal procedure. A bill by Mr. Adamson, of Georgia, defines the time in which action by a common carrier for the recovery of compensation of services can be started. The term is set at three years. A bill by Mr. Kahn, of California, for a similar purpose sets the term at one year.

A bill introduced by Mr. Cummins, of Iowa, provides that railroads shall not exempt themselves from liability by any stipulation in contracts, tickets, bills of lading, etc.

A bill introduced by Mr. Clapp, of Minnesota, allows ninety days for the settlement of claims against domestic shipments and six months for those from points outside of the United States.

A bill introduced by Mr. Shafroth, of Colorado, would make the common carrier issuing a bill of lading, liable to the lawful holder for loss, damage or injury to goods whether caused by it or by connecting carriers en route.

A bill introduced by Mr. Sims, of Tennessee, for the purpose of regulating the issuance of injunctions or suspensions against orders of the Interstate Commerce Commission, would require that the carriers pay into the court during the pendency of the suit, the difference between the rate fixed by the Commission and the new rate sought to be imposed.

Three measures are pending relative to rates. One by Mr. Pepper, of Iowa, which would make the discrimination and overcharges, the elements of damage to be measured by the differences between the rate charged the injured party and the rate charged other shippers under similar circumstances, even though rates have been declared reasonable in other respects.

Digitized by Google

A bill by Mr. Madden, of Illinois, would make the fact that a defendant carrier before the Commission voluntarily maintains a given rate under certain conditions, evidence of its reasonableness in its application to the same commodity over other portions of the lines of the defendant under substantially identical conditions.

A bill by Mr. LaFollette would abrogate the regulation covering short and long haul and through rates as provided in section four of the Interstate Commerce Act, with reference to Buffalo, Pittsburgh and points east.

Two bills bearing on bills of lading, have been introduced by Mr. Pomerene, of Ohio. One of these bills makes carriers liable to innocent endorsee or purchaser of bill when issued by the agent without receiving the goods. It also proposes to codify the obligations and rights of transfers and transferees. A variation from this bill is found in one introduced by Mr. Clapp, of Minnesota, which defines order and straight bills of lading and makes carriers liable to innocent endorsee or purchaser of bill on which an agent did not receive goods or which carrier did not make upon delivering goods.

In providing for livestock regulations, Mr. Mann has introduced a bill covering the feeding and watering of poultry in transit in which proper ventilation, types of cages and the removal of injured birds from crates are involved. Mr. Cline, of Indiana, has introduced a bill providing that carriers in transporting livestock must maintain an average speed of fifteen miles an hour. A bill by Mr. Gronna, of North Dakota, provides for the transportation of livestock at not less than twenty miles an hour.

Three measures are pending relating to the absorption of express business by railroads. A bill by Mr. Blackmon, of Alabama, requires all common carriers engaged in interstate and foreign commerce, to collect, accept, receive, transmit and deliver all express packages not exceeding in weight fifty pounds. A bill introduced by Mr. Campbell, of Kansas, would prevent common carriers from leasing or permitting other persons, firms, etc., to carry packages over their lines for hire and would compel the common carriers to furnish the necessary facilities. A bill of similar character has been introduced by Mr. Martin, of South Dakota.

Proposed baggage legislation includes a bill by Mr. Cummins, of Iowa, which fixes the amount of baggage of each passenger carried free at 150 pounds to include samples, catalogs, etc., of commercial travelers when packed in substantial trunks convenient for handling.

A bill has been introduced by Mr. Thomas, of Colorado, which would in effect, make all railroad tickets transferable by delivery.

Mr. Smith, of South Carolina, has introduced a bill to require all common carriers in interstate business to provide separate sleeping accommodations for the conveyance of white and colored passengers. A proviso is included that such accommodations must be equal in all respects as to comfort and convenience.

Acts in Restraint of Trade.—What constitutes a contract in restraint of trade is a matter that seems likely to figure in an important way in the discussion of the trust question during the coming winter session of Congress. The subject is figuring in many of the bills that are being offered, and attempts are being made from time to time to interest the trust programme framers of the Administration in developing a correct definition of what contracts are to be regarded as unduly restraining trade. The urgency for such a definition to be enacted into law has been gaining in strength for some time past, as is seen by the constant reappearance of plans relating to the subject, and may be regarded as certainly likely to be a part of the discussion which will constitute the foundation of the winter's work on trusts.

The Administration's Trust Program.—Joseph E. Davies, commissioner of the Bureau of Corporations, in a recent address before the National Association of Hardware dealers, announced the beginning of a new scientific investigation of the industrial situation under the direction of President Wilson, which will contribute to the administration's trust legislation program at the session of Congress beginning December 1st. The bureau will attempt to determine whether a competitive system of large units or a monopolistic system is the most advantageous to society.

"It is characteristic of the quality of mind of the President of the United States that he should desire facts on which to base his judgment," said Commissioner Davies. "There are now no governmental or other agencies engaged in attempting to get scientific information on this fact. We shall enter into this investigation with the sole intent of working out in a scientific and fair-minded spirit the facts, absolutely as they are. So vital and so fundamental is this problem that to attack it in any other spirit, would be criminal. What is needed is light; not heat. The problem bristles with difficulty. It will demand an increased appropriation from Congress. The results may not coincide with all we hope to procure, but we can, however, obtain facts that will contribute toward correct interpretation of industrial conditions as they exist."

Commissioner Davies declared that "This problem reaches down to the fundamentals of government itself; it will tax the greatest minds of this generation and the next. In its solution there is a call to all upstanding, thinking, patriotic men to aid in preserving conditions which shall safeguard the liberties of men, and that there may be an industrial freedom founded in this country which shall enable our children to be men—not slaves either to an industrial hierarchy or to a governmental despotism."

TRAFFIC.

A Prize Essay on Ticket Selling.—The Baltimore and Ohio Railroad has recently conducted a novel competition between its ticket agents by awarding a prize of $25 for the best essay submitted on the subject of "How a ticket agent should handle an undecided inquiring caller." After the examination of a large number of essays which were submitted from various parts of the system, the prize was finally awarded to Elias Bernstein, ticket agent of the Staten Island Railroad at Pleasant Plains, New York. Writing about the attitude of a ticket agent towards a prospective passenger, Mr. Bernstein said:

Digitized by Google

"A ticket agent is a salesman in the broad sense of the word. Salesmanship may be defined as the science and art of influencing the mind through the senses. The style of argument and the kind of reasoning to be used must be determined by the proposition the salesman is handling and the character of the buyer. Whether it be on the road with the line of merchandise or behind the ticket counter, the salesman must have at his command a thorough knowledge of his business and an understanding of human nature.

"Now you stop to think of it, it is a great art to handle a man in such a way as to win both his trade and his friendship. A living man is the most complex piece of machinery in the world. Compared to him, a locomotive is a play toy. The slightest blunder may cause him to work badly or to break down; yet there are no printed directions attached to him. All we can do is to watch his eyes and do our best.

"Now, let us suppose a case where an undecided caller steps up to the ticket window for information. He wants to know what advantage our road has over another which also runs to his destination. The agent has before him a prospective customer. His aim should be to convince that person and get his patronage. To do this certain golden rules must be closely adhered to. The first greeting from the agent must be a sunny smile. He must listen attentively and study the brand of information desired.

"Since first impressions are very lasting the company's servant must have at his fingers' tips facts and figures. It must also be kept in mind that it is easier to win a man through his eyes than his ears. Diagrams and maps are very helpful and speak for themselves. Lastly, you can never win a man by talking at him; you must talk with him.

"Psychology plays a prominent part in dealing with a doubtful individual. Say something pleasing to him and be cordial. If he is a business man he will respect your judgment if you tell him that the town is moving his way, or that you note the marked increase in his business. Then come to the point and answer his questions in a clear, matter-of-fact business-like way. It strengthens the arguments and shows self-confidence in the assertions made. Remark casually as you go along that that particular portion of the road-bed has lately been ballasted and that a new block system now protects it; mention the "Safety First" movement, it is a fine topic for conversation to explain that all the trains running at his objective point have fine observation platforms and that riding outside can keep his linen clean. These arguments which tend to insure safety and comfort outweigh the competitors' claim for speed and even a shorter route.

"Secure that man's business even if it is small. The company will give him satisfaction. A satisfied patron is an advertisement. It will create new travel and bring results."

Uniform Classification Meeting.—The Executive Commitee on Uniform Classification recently held a meeting in Chicago for the further consideration of a plan which is being worked out to bring about a uniformity in the classification of freight shipments. The Committee is making rapid progress in its work and up to the present time, the official Southern and Western Classifications have adopted 55 per cent of the classifications recommended by the Uniform Committee. In arriving at a common basis governing uniform classification, it has been necessary to study the rate question, industrial markets, the markets of production and consumption and many other phases of the transportation of freight, but despite the many difficulties and perplexities encountered, considerable progress is being made. As Vice-President Randolph, of the Baltimore and Ohio Railroad recently pointed out, it has been necessary in arriving at the best results to secure close co-operation between shippers and the railroads and at the same time, procure the approval of the Interstate Commerce Commission.

The railroad officials on the committee on uniform classification are as follows:

Official Classification Territory: George F. Randolph, vice-president, Baltimore and Ohio; B. Campbell, vice-president, New York, New Haven and Hartford; T. N. Jarvis, vice-president, Lehigh Valley; D. T. McCabe, vice-president, Pennsylvania Lines; W. C. Maxwell, general traffic manager, Wabash; D. W. Cooke, traffic manager, Erie; and C. F. Daly, vice-president, New York Central Lines.

Southern Classification Territory: H. F. Smith, vice-president, Nashville, Chattanooga and St. Louis; J. M. Culp, vice-president, Southern; A. R. Smith, vice-president, Louisville and Nashville; W. A. Winburn, president, Central of Georgia; F. B. Bowes, vice-president, Illinois Central; C. R. Capps, vice-president, Seaboard Air Line, and W. H. Pleasants, vice-president, Ocean Steamship Company.

Western Classification territory: H. R. McCullough, vice-president, Chicago and Northwestern; J. E. Gorman, vice-president, Chicago, Rock Island and Pacific; L. J. Spence, vice-president, Southern Pacific; C. G. Burnham, vice-president, Chicago, Burlington and Quincy; J. M. Johnson, vice-president, Missouri Pacific; C. Haile, vice-president, Missouri, Kansas and Texas; E. S. Keeley, vice-president, Chicago, Milwaukee and St. Paul; W. B. Biddle, vice-president, St. Louis and San Francisco, and Edward Chambers, vice-president, Atchison, Topeka and Santa Fe.

Boston Shippers Contest Differential Order.—D. O. Ives, chairman of the Transportation Committee, of the Boston Chamber of Commerce, recently declared that consideration is now being given to determine what are the proper legal steps to prevent the enforcement of the recent order of the Interstate Commerce Commission abolishing the port differentials favoring Boston as against New York. The order of the Commission, Mr. Ives asserts, requires heroic action both on the part of the Boston shippers and the railroad officials and he affirms that if it were literally followed, it would result in calamity to the port not contemplated by the framers of the law.

LEGAL.

Beginning of the Anthracite Coal Trust Suit.—The Philadelphia and Reading Railway, the Philadelphia and Reading Coal and Iron Company, the Wilmington and Northern Railway and the Lehigh and New England Railroad, have filed denials in the United States District Court

Digitized by Google

at Philadelphia, that they are parties to an alleged combination in restraint of the anthracite coal trade. These denials are in reply to the suit brought by Attorney-General McReynolds on September 2nd. This is the second step taken on the part of the Government in its efforts to break up what it alleges to be an illegal combination. It desires to bring about the separation of the Central Railroad of New Jersey and its affiliated companies from the Reading system and also seeks to separate the Reading Company from the Coal and Iron Company and from the Railway Company and other smaller concerns.

The answers of the Reading companies admit the reorganization of companies and the several leases which the Government complains of in its action, but the companies aver that none of the leases, reorganizations or traffic arrangements were made for an illegal purpose. The answer of the Reading Company denies that "this company, Philadelphia & Reading Railway Company and the Philadelphia & Reading Coal & Iron Company are one and the same association of persons engaged in mining, selling and transporting coal, or in any one of these lines of business or otherwise, either under the direction of any of the persons mentioned in the Government's petition."

The answer of the Reading Company also denies that it has at any time monopolized the production and transportation of anthracite in and from the Schuylkill region or attempted to gain a monopoly in any other hard coal field.

All the companies making answer deny that they are parties to any agreement to control or monopolize either the production of anthracite or its transportation from the mines in Pennsylvania to market points in other States, or its price or sale in or throughout other States, and they, therefore, ask that the suit against them be dismissed.

Commerce Court's Last Days.—Rapid work is being done by the Commerce Court in order to clear its docket by December first, the day on which it ceases to be a Court. The tribunal has a number of interstate commerce cases that have been under its consideration for some time and every effort is being made to dispose of them before the Court finally adjourns.

Conviction Under the Carlin Law.—The Carlin bill, recently passed by Congress, making the robbery of freight cars, baggage cars and express cars, engaged in interstate commerce and the robbery of shipments from platforms and stations, a federal offense, was applied recently in the Federal Courts at Birmingham, Alabama, when John L. Parker was given a sentence of six years in the United States prison for robbing a shipment of shoes consigned to Glazen, Miss., from a car in the Birmingham yards on May 4th. Parker was also implicated in robbing a shipment of notions consigned to Avondale, Ala., from a car in the Birmingham yards on the night of July 30th and Otis Williams and Arthur Goodeye, who assisted him, were given sentences of four years and six months and three years and six months respectively in the United States prison.

Under the Carlin law, the prosecution of car and depot thieves is greatly simplified and the certainty of conviction is much greater, as the federal statutes do not provide the loopholes found in various States' laws through which many criminals whose guilt was clearly proved have been enabled to escape on technicalities.

STATE COMMISSIONS.

Arkansas.—All railroads in Arkansas are affected by a recent ruling of the State Commission establishing a flat, rough material rate on lumber of two cents per hundredweight on the first twenty-five miles of travel and increasing one-fourth of a cent for each additional ten miles.

A minimum weight limit of 40,000 pounds per car for cars so rated was ordered, and in cars of less than 40,000 pounds capacity the minimum weight will be the marked capacity of the car.

Illinois.—Drastic action will be taken by the railroad and warehouse commission against railroads which neglect to comply with the headlight law passed at the last session of the legislature. Complaint against a number of rail lines which have failed to obey provisions of the act has been made by labor organizations.

The law provides that locomotives used in passenger service, except suburban, shall be equipped with headlights of sufficient candle power to throw a light in clear weather that will enable the engineer to discern an object "the size of a man" upon the track at a distance of 800 feet from the headlight. On engines used in freight service, exclusive of switching, the distance is restricted to 450 feet, and on engines operated in switching and suburban passenger service it is placed at 250 feet.

Members of the Railroad & Warehouse Commission have decided to enforce a general switching rule in all Illinois cities and towns, with the exception of Chicago and East St. Louis. A conference on the subject was held in the offices of the Commission by the commissioners, downstate shippers and traffic officials in October. It was agreed that a committee of ten members, representing both the railways and shippers, should prepare a tentative rule for switching service and submit it to the Commission for approval within thirty days.

A supplement to the Illinois freight classification containing additions, cancellations and changes in the classification of forty-two articles of merchandise, has been issued by the State Railroad and Warehouse Commission.

Massachusetts.—The Public Service Commission has formulated a tentative order as a feeler for what publicity should be given to certain kinds of expenses of railroads, street railways and telephone companies. The order contemplates that the railroads, railways and telephone companies shall file sworn monthly statements of all payments for advertising, all salaries and expenses paid through the legal departments. All payments for legal services to persons not regularly connected with the legal departments, all payments in connection with legislation, all kinds of political campaign contributions and all "other expenses," "general expenses" and "general miscellaneous expenses." These statements are to show the names of persons, firms or corporations to whom the payments are made and the character of the service rendered.

Digitized by Google

Minnesota.—The Railroad and Warehouse Commission has announced the proposed schedule of freight rates provided by the Cashman distance tariff law, passed by the last Legislature and which becomes effective January 1st. Merchandise rates under the new system are slightly higher on shipments up to 125 miles than the rates upheld by the Supreme Court of the United States in the Minnesota rate case, lower from 125 to 300 miles, and higher from 300 to 400 miles. Commodity rates are the same as the present maximum, with the exception of lumber, which has been slightly reduced.

The Chicago Great Western Railroad entered a protest with the State Railroad and Warehouse Commission against the proposed test of the new State rates held valid as to certain railroads by the recent United States Supreme Court decision. The Commission is not inclined to grant the request, and the case of the Great Western may again come up in the federal courts. An injunction restraining the State from enforcing its reduced tariffs after July 1, 1911, was obtained by the Great Western and never has been dissolved. After the Supreme Court decision the Great Western asserted its earnings were on a par with those of the Minneapolis and St. Louis, which road the Supreme Court exempted on the ground that the new rates would be confiscatory.

State officials and representatives of the Great Western recently agreed upon a test period of four months, to begin October 1st, during which time accurate accounts should be kept on the road's earnings. The Great Western now claims the expense of such a procedure is too great and asks that the case be tried on its merits.

Nebraska.— Seven railway companies doing business in Nebraska have filed with the Railway Commission of the State a notice of an appeal to the Supreme Court of Nebraska on the recent decision of the Commission to reduce freight rates on apples, peaches and pears in carload lots. The roads announced that the new rates would be effective, however, pending the action of the higher court.

New York.—Legal representatives of the Erie Railroad Company on October 6th, requested the Public Service Commission for permission to issue gold equipment trust obligations to the amount of $5,790,000. The Commission took the application under advisement.

The up-State Public Service Commission entered an order early in October, providing for inquiry and investigation into the rates charged by express companies operating over steam railroads within New York State. The Commission named the following companies as respondents:

American Express Co., National Express Co., United States Express Co., Wells Fargo & Company Express, and Adams Express Co.

These companies were directed to file with the Commission, on or before October 20th, a statement in writing showing what, if any, changes in the rates and regulations they desire to establish and make effective with a view to reductions in their charges.

Texas.—The railroads of Texas are much disturbed over an order which has just been issued by the State Railroad Commission, as follows: "In all cases where shipper or consignee has an industry or warehouse located directly upon team or other public delivery tracks, out of and into which goods can be loaded or unloaded into or out of cars without wagon haul, switching service, at the charges and under the regulations in this tariff (general switching tariff) provided, shall be performed. Except as hereinbefore specified, carriers will not be required to switch to or from such public delivery tracks."

The effect of the above order is to compel the railroads to switch from one line to another in switching limits where the industry or warehouse is located on a delivery track. They have been refusing to do it on the ground that it was a competitive local situation and they should not be forced to do it. They were sustained by a rule of the Commission, which is now abrogated.

The Texas Railroad Commission has authorized the issuance of $800,000 of bonds by the San Antonio, Uvalde & Gulf Railroad, making the total amount outstanding $3,663,000. The bonds are part of an issue of $13,500,000 first mortgage five per cent 30-year gold bonds, dated February 1, 1913.

BOOK REVIEWS.

"Freight Classification," By E. R. Dewsnup.—There is no subject of more importance to the traffic man than freight classification. In his new treatise on the subject, published by the LaSalle Extension University, Chicago, Professor Dewsnup has furnished a simple and practical treatment of freight classifications and one which will be valuable alike to the layman and to the experienced traffic man. The application of classifications and exceptions, the principles of classification and rate-making, and uniform classification are treated in an eminently practical and interesting manner.

A very unique feature of the treatise is the appendix. The information contained therein has never before appeared in any one publication. Appendix A contains descriptions of territories, groups, and points used in the handling of traffic as described in various publications of the carriers. Appendixes B and C contain definitions of traffic terms and abbreviations in common use. Appendix D shows detailed application of classifications both within and without their respective territories. These appendixes furnish valuable reference material in the most convenient form. Mr. Dewsnup is Professor of Railway Administration at the University of Illinois. He is editor of and contributor to "Railway Organization and Working" and author of numerous articles and reviews dealing with railway topics.

Routing Freight Shipments.—There are a great many factors that a traffic man must consider when routing freight. In his treatise on "Routing Freight Shipments," Mr. J. F. Morton, assistant traffic director of the Chicago Association of Commerce, who is an expert in routing freight shipments, and who prepares the "Package Car Service Bulletin" for the journal, "Chicago Commerce," sets these factors out very clearly in a brief space. The author not only shows the principles that the shipper should consider when making a shipment, but also shows why certain ways of routing shipments that are in more or

Digitized by Google

less common use fail to attain the desired results. In the conclusion to this treatise, the author shows by concrete examples how failure to weigh all the factors to be considered in routing may work injury to the shipper and inconvenience to the carriers. "Routing Freight Shipments" is published by the LaSalle Extension University, Chicago.

Freight Claims.—One of the reasons that shippers secure poor results in the handling of freight claims is that the claims are not properly filed so that the carrier may have sufficient data to investigate the merits of the claim intelligently. To overcome this difficulty by presenting the correct methods of filing freight claims, W. A. Trimpe, a Chicago lawyer formerly connected with one of the largest firms in the country handling freight claims, sets out in concrete form the proper methods for handling claims, in a treatise published by the LaSalle Extension University, Chicago. The author has shown in this treatise how to file the different kinds of claims in a way to cause the carrier no unnecessary work and at the same time secure prompt and satisfactory adjustment. Every step in the handling of the claim from the industrial man's standpoint is clearly set out, and to assist those who are not familiar with the subject of freight claims, the more important documents appearing in the investigation of a claim for damage are shown.

ELECTIONS AND APPOINTMENTS.

Executive.

William J. Cunningham, vice-president's assistant, New York, New Haven & Hartford Railroad. Headquarters, New Haven, Conn.

Howard Elliott, chairman of the board of directors, New York, New Haven & Hartford Railroad. Headquarters, New Haven, Conn.

George S. Hobbs, second vice-president of the Maine Central R. R. Headquarters, Portland, Me.

Frederick S. Holbrook, vice-president in charge of traffic, Wells Fargo and Co. Express. Headquarters, New York.

James H. Hustis, president, New York, New Haven & Hartford Railroad. Headquarters, New Haven, Conn.

E. T. Lamb, receiver, Atlanta, Birmingham & Atlantic R. R.

Clement W. Nelson, assistant to the president, St. Louis, Southwestern Railway. Headquarters, St. Louis, Mo.

J. W. Newlean, vice-president and comptroller, financial accounting and supply departments, Wells Fargo and Company. Headquarters, Chicago, Ill.

C. H. Porter, chief clerk to the president, Western Maryland Railroad. Headquarters, Baltimore, Md.

Alexander Robertson, president, American Refrigerator Transit Company.

E. H. Ryan, president, Muscatine North and South Railway. Headquarters, Muscatine, Iowa.

Thomas M. Schumacker, chairman of the Board, Chicago, Rock Island and Pacific Railway.

W. L. Seddon, vice-president, Macon, Dublin & Savannah Railroad.

E. C. Smith, president, Central Vermont Railroad. Headquarters, St. Albans, Vt.

W. T. Stringer, assistant to the president, Western Maryland Railroad. Headquarters, Baltimore, Md.

Charles N. Voss, vice-president and treasurer, Muscatine North and South Railway. Headquarters, Muscatine, Iowa.

J. D. Watson, vice-chairman, Southwestern Tariff Committee. Headquarters, St. Louis, Mo.

James G. Woodworth, vice-president in charge of traffic, Northern Pacific Railroad. Headquarters, St. Paul, Minn.

Legal.

J. P. Blair, general counsel, Southern Pacific Company. Headquarters, New York.

Thomas Bond, commerce counsel, St. Louis and San Francisco Railroad. Headquarters, St. Louis, Mo.

T. H. Burgess, assistant general solicitor, Erie Railroad.

Fred H. Wood, general attorney and commerce counsel, Southern Pacific Company. Headquarters, New York.

Financial.

J. C. Brinton, assistant secretary, Erie Railroad. Headquarters, New York.

H. B. Holbert, secretary, Muscatine North and South Railway. Headquarters, Muscatine, Iowa.

J. W. McCullough, secretary and treasurer, Sour Lake and Western Railroad.

Accounting.

G. W. Briece, car accountant, Missouri Pacific Railway. Headquarters, St. Louis, Mo.

E. A. Chavannes, auditor, Pacific and Idaho Northern Railway, and the Central Idaho Telegraph and Telephone Co. Headquarters, New Meadows, Idaho.

M. T. Coogan, auditor, Ashley, Drew and Northern Railway. Headquarters, Crossett, Ark.

E. Deschenes, Jr., auditor, Central Vermont Railway. Headquarters, St. Albans, Vt.

W. C. Everett, auditor, Virginian Railway. Headquarters, Norfolk, Va.

E. I. Grenfell, consulting auditor, Wichita Valley Ry. Headquarters, Fort Worth, Texas.

William Hough, general auditor, Pullman Co. Headquarters, Chicago, Ill.

E. C. Morris, auditor, manufacturing department, Pullman Company.

William Riley, auditor, ticket accounts, Pullman Company.

George S. Seymour, auditor of miscellaneous accounts, Pullman Company.

R. G. Shorter, assistant auditor, Georgia and Florida. Headquarters, Augusta, Ga.

Frederick L. Simmons, assistant general auditor, Pullman Company. Headquarters, Chicago, Illinois.

W. H. Vincent, assistant auditor, Georgia Railroad. Headquarters, Augusta, Ga.

Engineering and Mechanical.

Edward L. Adams, assistant signal engineer, Lake Shore and Michigan Southern and the Dunkirk, Allegheny Valley and Pittsburgh. Headquarters, Cleveland, Ohio.

Walter U. Appleton, general master mechanic, Intercolonial Railway and the Prince Edward Island Railway. Headquarters, Moncton, N. B.

J. C. Basford, assistant road foreman of engines, Philadelphia district, Baltimore and Ohio Railroad. Headquarters, Philadelphia, Pa.

George E. Beck, chief signal inspector, Lake Shore and Michigan Southern Railway. Headquarters, Cleveland, Ohio.

H. T. Bentley, superintendent of motive power and machinery, Chicago and Northwestern. Headquarters, Chicago, Ill.

Charles Bowersox, master mechanic, Toledo & Ohio Central and Zanesville & Western railways. Headquarters, Bucyrus, Ohio.

H. G. Castron, master mechanic, Chicago, Burlington & Quincy Railway. Headquarters, Brookfield, Mo.

G. H. Cumberland, division engineer, Oregon Short Line Railroad. Headquarters, Pocatello, Idaho.

Gilbert Dempster, master mechanic, Southern Railway Co. Headquarters, Columbus, Miss.

C. E. Denney, special engineer, New York Central Lines West. Headquarters, Chicago, Ill.

J. A. Donahey, superintendent and chief engineer, Akron, Canton and Youngstown Ry. Headquarters, Akron, Ohio.

W. J. Fraudendiener, master mechanic, Eastern division, Cleveland, Cincinnati, Chicago & St. Louis. Headquarters, Bellefontaine, Ohio.

W. J. Frey, supervisor of materials, Lake Shore and Michigan Southern. Headquarters, Cleveland, Ohio.

George H. Funk, chief smoke inspector for all railroads entering Cincinnati, Ohio.

R. D. Garner, engineer of construction, Southern New England Railroad Corporation and the Southern New England Railway Co. Headquarters, Providence, R. I.

Joseph Graham, superintendent of locomotive shops, Intercolonial and Price Edward Island Railways. Headquarters, Moncton, N. B.

P. H. Hamilton, terminal roadmaster, St. Louis and San Francisco Railroad. Headquarters, Memphis, Tenn.

E. S. Heyser, division engineer, St. Louis, Brownsville and Mexico Railway. Headquarters, Kingsville, Texas.

F. Hodnapp, road foreman of engines, Illinois division, Baltimore and Ohio Southwestern R.R. Headquarters, Flora, Ill.

Mark Jefferson, assistant master mechanic, Lehigh Valley Railroad. Headquarters, Easton, Penna.

C. W. Johnson, consulting engineer, Chicago, St. Paul, Minneapolis & Omaha Ry. Headquarters, St. Paul, Minn.

F. W. Kane, assistant chief engineer, Missouri, Kansas & Texas Railway. Headquarters, Dallas, Texas.

R. G. Kenly, chairman of valuation committee, Minneapolis & St. Louis Railroad.

P. H. Kilpatrick, chief engineer, Texas City Terminal Co. Headquarters, Texas City, Texas.

B. D. King, roadmaster, Lake Erie and Western R. R. Headquarters, Lima, Ohio.

Hugh D. Mackenzie, division master mechanic, Intercolonial Railway. Headquarters, Stellarton, N. S.

C. A. McCarthy, master mechanic, Colorado Springs & Cripple Creek District Railway. Headquarters, Colorado Springs, Colo.

B. B. Milner, special engineer, New York Central Lines. Headquarters, New York City.

H. S. Mored, master mechanic, Chicago, Burlington and Quincy Railroad. Headquarters, Aurora, Ill.

George A. Moriarity, master mechanic, New York, New Haven and Hartford R. R. Headquarters, Boston, Mass.

W. W. Morrison, engineer maintenance of way and structures, Pittsburgh and Shawmut R. R. Headquarters, Kittanning, Pa.

J. E. O'Brien, assistant mechanical superintendent, Missouri Pacific and St. Louis, Iron Mountain and Southern. Headquarters, St. Louis, Mo.

W. J. O'Neill, master mechanic, Pan Handle and Indian Territory divisions, Rock Island Lines. Headquarters, Shawnee, Okla.

S. H. Osborne, division engineer, Oregon Short Line Railroad. Headquarters, Pocatello, Idaho.

H. H. Parker, general foreman, Seaboard Air Line Ry. Headquarters, Portsmouth, Va.

Robert Quayle, general superintendent of motive power and car departments, Chicago and Northwestern. Headquarters, Chicago, Ill.

OBITUARY.

William E. Barnett, former vice-president of the New York, New Haven & Hartford R. R., who has been in ill health for some time, died October 10th, at Pinehurst, N. C. Mr. Barnett was born February 20, 1845, at Charleston, S. C. He was graduated from Yale University, class of 1864 and later attended Albany Law School. He entered railway service with the New York, New Haven & Hartford R. R. in 1869, as president's secretary. In 1887 he became executive secretary and later was attorney for the company. Mr. Barnett was elected third vice-president at the head of the department of law, real estate and taxes in January, 1900, and he served in that capacity until 1904 when he was compelled to retire on account of ill health.

Frank E. Brown, first assistant general passenger agent of the Boston & Maine, at Boston, Mass., died at his home in Concord, N. H., on October 27th. He was born in 1850, at Claremont, N. H., and entered railway work in August, 1868. He was clerk and bookkeeper in the cashier's office, until 1880, and was subsequently superintendent's clerk and then was general ticket agent of the Concord Railroad. From January, 1890, to July, 1895, he was general passenger and ticket agent of the Concord & Montreal, and in July, 1895, was appointed assistant general passenger and ticket agent of the Boston & Maine (which absorbed the C. & M.), with headquarters at Concord. Since October, 1910, he had been first assistant general passenger agent, and also was general passenger agent of the Mount Washington Railway.

Benjamin W. Carskaddon, real estate agent of the Pennsylvania Railroad, with office at Philadelphia, Pa., died on October 23rd, at Atlantic City, N. J. He was born in February, 1858, at Philadelphia, and received a public school education in that city. He studied conveyancing and attended the real estate law course at the University of Pennsylvania. In February, 1879, he entered the service of the Pennsylvania Railroad in the office of the general solicitor as a conveyancer; but he resigned three years later to go into the real estate business in Pittsburgh. He returned to the service of the railroad company in March, 1885, as agent at Pittsburgh for the real estate department, and had been in the service ever since. From January, 1893, to January, 1900, he was in the office of the real estate agent at Philadelphia, in charge of the branch of that department relating to the taxation of real estate; and then was assistant real estate agent, until his appointment in May, 1902, as real estate agent in charge of the department. In his capacity as real estate agent, Mr. Carskaddon has for many years had supervision of the road's real estate transactions, which are numerous and important. One of these was the purchase of the land for the Pennsylvania station and its approaches in and around New York City, involving many millions of dollars and several years' time.

Maxwell Evarts, general counsel of the Southern Pacific with headquarters at New York, died on October 7th, at his summer home at Windsor, Vt. He was born on November 15, 1862, in New York City, and graduated from Yale University in 1884, and went to Harvard Law School. For a time he was engaged in law work in the office of W. D. Guthrie and was for a time assistant United States district attorney. He spent some time in the West on a ranch, and his first railway work was as an attorney for the Southern Pacific in 1893. Shortly after this he gave up private practice almost entirely and had been engaged in law work for the Southern Pacific ever since. His most important work for the Southern Pacific had been in connection with appeals to the United States Supreme Court. He argued nearly all of the cases that were carried to the Supreme Court, either jointly with the counsel that tried the cases in the lower courts or alone. He took Judge Lovett's place as general counsel of the Harriman Lines in October, 1910, and early in 1913, when the Southern Pacific was separated from the Union Pacific he resigned as general counsel of the Union Pacific, remaining with the Southern Pacific as general counsel. He was also a director of the Southern Pacific. Mr. Evarts was a man who took life smilingly and who took a keen interest in his country place in Vermont. A few years ago he served two terms in the Vermont legislature. Mr. Evarts was the son of the late Secretary of State William Maxwell Evarts.

Charles A. Florence, export and import agent of the Illinois Central at Chicago, died in that city on October 7th. He was born on June 8, 1857, at Chicago, and began railway work in 1877 as a clerk. From 1879 to 1887 he was agent in the Chicago office of the Iowa Railroad Land Company and then to 1890 was traveling passenger agent of the Illinois Central for Canada and had been in the continuous service of that road ever since. From February, to November, 1890, he was New England passenger agent, and then to September, 1897, was general agent of the freight and passenger department for New England at Boston, Mass., becoming general eastern freight agent in September, 1897, at New York. In September, 1910, he was appointed assistant general freight agent at Chicago; in May, 1911, he was made assistant general foreign freight agent, and sinch March, 1912, has been export and import agent of the same road.

Ralph D. Gillett, president of the Hampden Railroad Corporation, a subsidiary of the New York, New Haven & Hartford R. R., died at Westfield, Mass., October 15th, aged 47 years.

William G. Gordon, assistant auditor of the treasury department of the Chicago, Burlington & Quincy, at Chicago, died at his home at Hinsdale, Ill., on November 1st.

William McCullough Grafton, signal engineer of the Pennsylvania Lines West of Pittsburgh, Pa., with headquarters at that city, died on October 10th, at Atlantic City, N. J.

H. W. Hartman, president of the Denver & South Platte, died at Denver, Colo., on September 29th, aged 63 years.

Samuel B. Haupt, president and general manager of the Susquehanna, Bloomsburg & Berwick R. R., died on September 28th, at his home in Milton, Pa., aged 64 years.

D. E. Hooper, supervisor of bridges and buildings of the Southern Railway, at Lawrenceburg, Ky., died October 20th.

S. M. Hudson, auditor of the Fort Worth & Denver City, with headquarters at Fort Worth, Texas, died September 30th, at the Mayo sanitarium at Rochester, Minn., aged 64 years. Mr. Hudson began railway work in May, 1892. He was made auditor of the Fort Worth & Denver City in March, 1899, and had been consulting auditor also of the Wichita Valley since May, 1907.

William A. Ingham, formerly president of the East Broad Top R. R. and Rock Hill Iron & Coal Co., died September 23rd, at Philadelphia, aged 87 years.

Jacob Johann, from 1892 to 1897 superintendent of machinery of the Chicago & Alton, died recently at his home in Springfield, Ill. He was born at Rheinzabern, Bavaria, Germany, on November 15, 1830. He began railway work in November, 1858, and to July, 1861, was assistant to master mechanic on the Missouri Pacific, subsequently for about four years he was master mechanic in shops on the Southwest branch at Pacific City, Mo. From March, 1865, to May, 1868, he was general master mechanic of the Missouri Pacific, and from April, 1870, to January, 1872, held the same position on that road. In October, 1872, he was appointed general master mechanic of the Chicago & Canada Southern, and from June, 1874, to November, 1884, was general master mechanic of the Wabash, St. Louis & Pacific, and then to May of the following year, was superintendent of motive power and machinery of the same road. From July to November, 1885, he was master mechanic of the Missouri, Iowa & Nebraska, now part of the Chicago, Burlington & Quincy, and then to December, 1886, was master mechanic of the Chicago & Atlantic, now part of the Erie. He was appointed superintendent of motive power and rolling stock of the Texas & Pacific at Marshall, Texas, in December, 1886, remaining in that position until June, 1888; subsequently he had charge of the Chicago office of the Safety Car Heating & Lighting Company, and from November 5, 1892, to February, 1897, he was superintendent of machinery of the Chicago & Alton. Previous to entering railway service he was for twelve years employed in various locomotive work.

Joseph Robinson Parrott, president of the Florida East Coast Ry., died at his summer camp at Oxford, Me., October 13th. He had been apparently in normal health but a sudden attack of angina pectoris proved fatal. Mr. Parrott was born at Oxford, Me., October 30, 1859. He was educated at Yale College and Law School and began his railroad career as an attorney with the Jacksonville, Tampa & Key West Ry. He was subsequently general attorney and land commissioner and also, from 1890 to 1892, receiver for the Florida Southern Ry. Mr. Parrott was general counsel of the Jacksonville, St. Augustine & Halifax River Ry., and its successor, the Jacksonville, St. Augustine & Indian River Ry., until 1892. He was elected vice-president of that road in November, 1892. In 1895 the name of the road was changed to the Florida East Coast Ry., and in 1910, Mr. Parrott was elected president. The remarkable development of Florida has followed the building and improvement of the Florida East Coast Ry. This has been the work of Mr. Parrott and the late H. M. Flagler.

E. S. Prindiville, traveling passenger agent of the Chicago, Burlington & Quincy, at Pittsburgh, Pa., died on October 20th, in that city, at the age of 31. He was born in Chicago, and began railway work in October, 1902, as a clerk on the Burlington, and had been in the continuous service of that road ever since. In 1903 he was made cashier, and later became passenger agent. Since 1906 he had been traveling passenger agent of the same road, at Pittsburgh.

Frederick L. Rawlins, superintendent of telegraph of the Southern Pacific Co., died October 17th, in the company's general hospital in San Francisco, Cal., aged 59 years. He had been in railway service since 1873 and had been superintendent of telegraph of the Southern Pacific since June, 1908.

William F. Ray, general superintendent of the Boston & Maine R. R., died suddenly September 26th, at Boston, Mass. Mr. Ray was born at

Digitized by Google

South Vernon, Vt., in 1857. He was educated at Fort Wayne and at Notre Dame University, South Bend, Ind., entering the service of the Connecticut River R. R., now a part of the Boston & Maine, in 1874. He was a locomotive fireman, brakeman, freight and passenger conductor, trainmaster and then assistant superintendent. He was appointed superintendent of the Concord division of the Boston & Maine, in 1903, from October, 1911, to October, 1912, was superintendent of the Portland division and since the later date has been general superintendent of the Boston & Maine with office at Boston, Mass.

William Osbourne Sprigg, formerly superintendent of the New York division of the Lehigh Valley, died on October 26th, at his home in Tompkinsville, Staten Island, N. Y. He was born in 1865, at Cumberland, Maryland, and began railway work in March, 1879, as a rodman and levelman on the George's Creek & Cumberland. He was subsequently assistant engineer of the Baltimore & Cumberland Valley, now a part of the Western Maryland; assistant engineer of the Pittsburgh & Western and then to December, 1882, was engineer of construction. In December, 1882, he was appointed master of road on the Baltimore & Ohio, and three years later became engineer of maintenance of way of the New York extension of the same road. From September, 1886, to November, 1894, he was master of transportation of the Staten Island Rapid Transit Railroad, and then was superintendent of the same road. In May, 1897, he was appointed division superintendent of the Southern Railway, and from September, 1898, to August, 1904, was superintendent of the New York division of the Lehigh Valley. He then left railway work to organize the General Contracting & Engineering Company, of which he was president at the time of his death.

F. P. Weymouth, former division superintendent of the Northern Pacific Ry., at Sprague, Wash., and at Spokane, Wash., died October 23rd, in Spokane, aged 76 years.

E. T. White, district superintendent of motive power of the Baltimore & Ohio, at Baltimore, Md., died at his home in that city on September 26th. He was born on October 16, 1858, at Fellowsville, Va., and began railway work in 1874, as a machinist apprentice on the Baltimore & Ohio, remaining in that position for four years. He was then, consecutively, gang foreman, roundhouse foreman, and general foreman of locomotive repairs on the same road, and from June, 1889, to February, 1895, was master mechanic on the Baltimore division. He was then transferred as master mechanic to the Philadelphia division, and from March, 1899, to May, 1905, was superintendent of motive power for the lines east of the Ohio River, and since that time has been successively superintendent of motive power on lines east of the Ohio River and lines in Pittsburgh territory, and superintendent of motive power of the main line. His entire service has been with the Baltimore & Ohio.

Luther Reese Zollinger, engineer maintenance of way of the Pennsylvania Railroad at Philadelphia, Pa., died on October 21st, after a short illness, at his home in Merion, Pa. He was born in Harrisburg, Pa., on April 25, 1865, and graduated from high school and from Lehigh University, with the degree of civil engineer. He entered the service of the Pennsylvania Railroad on March 11, 1889, as a rodman in the office of the division engineer at Harrisburg. From February, 1891, to the following June, he was transitman at Altoona, and then to November, 1895, was assistant to division engineer, Philadelphia division, West Philadelphia. In November, 1895, he became assistant supervisor at Spruce Creek, and in October, 1898, was made supervisor at Norristown, later becoming supervisor at West Philadelphia. From May, 1902, to November, 1903, he was assistant to principal assistant engineer, Pennsylvania Railroad division at Altoona, and then, to April, 1905, was principal assistant engineer of the same division. On April 1, 1905, he was promoted to engineer of maintenance of way of the Pennsylvania Lines East, with office at Philadelphia, and since June 16, 1913, he had been in entire charge of the maintenance department. Mr. Zollinger's entire service had been with the Pennsylvania Railroad.

When caution becomes a habit there will be few accidents.

To avoid danger adopt the safe course.

Energy usually brings success, and success invariably brings energy.

Vigilance and watchfulness promote safety.

Be cautious and alert at all times and under all conditions.

REMEMBER THE RULE: When in doubt, take the safe way.

Half the value of anything to be done is to do it promptly.

No man can be poor with a heart full of hope.

Aim high though the bow break in bending.

Soiling one will never make another clean.

Before crossing and tracks, STOP, LOOK and LIST.

The prevention of accidents is your most important duty.

Increased Efficiency Procured from Heavy Loading of Cars.

(From a Correspondent.)

ONE of the most important problems for both the railroads and the shipping public to solve to-day is the question of Greater Car Efficiency.

In this connection, the following is submitted to indicate to what extent the United States Steel Corporation's constituent companies have been instrumental in creating a car supply during the year 1912 by increasing the average carload from 34 to 36 tons.

A comparative statement of the average carload of outbound traffic for the years 1911 and 1912 for the American Bridge Company, American Sheet and Tin Plate Company, American Steel and Wire Company, Carnegie Steel Company, H. C. Frick Coke Company, Illinois Steel Company, National Tube Company, Pittsburgh Steamship Company, Tennessee Coal, Iron and Railroad Company, and Universal Portland Cement Company produces the following result:

During the year 1911, the average carload was 34.6 tons, and for the year 1912, the average carload was 36.2, or an increase of 1.6 tons per carload. This increase of 3,200 pounds to the aver-

Digitized by Google

age carload on outbound shipments means there were 76,105 fewer cars used to handle an equal tonnage as compared with the average carload of the year 1911, based on the outboound traffic of the above ten companies.

Both the shippers and the railroads have been benefited to almost an immeasurable extent in the switching and weighing avoided, i. e., the great saving in operating expenses; switching service on 76,105 cars or 152,210 terminal movements, and the expense of handling this additional number of both empties and loads through the various classification or interchange yards of the railroads from point of shipment to destination.

Figure this in any manner that you may, it will prove conclusively the money value of conserving the freight car equipment, not only when there is a severe car famine, but at all times.

To illustrate: One company saved 122 cars by loading only 100 pounds heavier per car during the year 1912.

The record of another company emphasizes the importance of heavier loading perhaps more than any other example, for even with only four hundred pounds per car increase on its traffic means that 15,836 fewer cars were required to move the same tonnage.

Consider what the shippers of the Pittsburgh district generally could accomplish in the way of creating a car supply by increasing the average load per car. Based on the total Pittsburgh district tonnage for the year 1912, an increase in the average carload on approximately the same basis per car, would have resulted in the same tonnage moving in 409,524 fewer cars.

These figures not only indicate the large number of cars that would be available for shippers, as the record made by the U. S. Steel, of two tons but based on an average haul of 100 miles, the increase of 1.6 tons per car would decrease the car mileage 40,952,400 car miles.

While the Pittsburgh district tonnage is merely used as a basis for computation, there can be no question but what even a more remarkable showing could be made in increasing the average carload throughout the country generally, if the railroads would bring this subject before the shipping public.

Electrical Trucks in Freight House Service.

ELECTRIC storage battery trucks were first introduced in railway service for the handling of baggage and mail. They have proven a success in this work, and have been installed by a number of prominent railways. More recently the same class of truck has been introduced in freight house service and has been found to be both efficient and economical. Several roads now have them in constant operation, while a number of coatwise and lake steamship lines are finding them of service in helping to solve their terminal problems.

It is reported that the first large installation of this class of truck for the handling of railroad freight was made by the Erie Railroad, by whom twenty-four trucks were installed at its Jersey City terminal on Transfer Pier No. 6. The following detailed comparison of the cost of handling freight for one year after the installation of electric trucks, with the operation with hand trucks for the year before, shows the relative economy in favor of the electric trucks:

Tonnage handled	Electric trucks. 170,170 tons.			Hand trucks. 183,371 tons.		
	No. men.	Amount paid.	Cost per ton.	No. men.	Amount paid.	Cost per ton.
Fixed charges—Foreman, clerks, cooper and sealer	9	$6,425.38	$0.038	9	$6,392.01	$0.035
Checking—Checkers and callers	13	8,715.13	.051	17	10,830.23	.059
Labor—Loaders, stevedores, truckers	57	31,455.33	.185	103	54,119.00	.295
Total operating cost	79	$46,595.84	$0.274	129	$71,341.24	$0.389
Decrease with electric trucks				50	$24,745.40	$0.115

In addition to the labor cost for handling the freight the operation of the trucks required a day and night electrician and a helper, the yearly wages of the three men being $2,031.69. The electric current consumed cost $962.22 the trucks averaging a fraction over 7 k. w. per day each. The trucks are charged from a power line supplied by the generating station which furnishes light and power for the Jersey City terminal at night.

NOTICE OF ASSESSMENT.

PHILADELPHIA ELECTRIC COMPANY.
New Jersey Office, 419 Market Street, Camden, N. J., Philadelphia Office, S. W. cor. 10th and Chestnut Streets.

NOTICE OF ASSESSMENT.

The stockholders of the Philadelphia Electric Company are hereby notified that by a resolution of the Board of Directors of the said Company, adopted at a meeting held this 28th day of October, 1913, an assessment of five dollars ($5) per share upon shares of stock of said Company subscribed for, being an assessment of twenty per cent. (20%) upon the par value of such shares, has been made and called for, payable to the order of this Company at its office, 1000 Chestnut street, Philadelphia, on or before the 1st day of December, 1913.

You are further notified that an extra dividend of one dollar and fifty cents ($1.50) per share on each share of the stock of the Company has been declared from the surplus arising from the business of the Company, payable on the 1st day of December, 1913, at 1000 Chestnut street, Philadelphia, to the stockholders of record at the close of business on the 20th day of November, 1913.

The transfer books will be closed on the 20th day of November, 1913, at three o'clock P. M., and opened on the third day of December, 1913, at the hour of ten o'clock A. M.

No transfer will be made of any certificate upon which payment of the assessment has not been made.

Stock certificates must be presented when payment is made, in order that the same may be properly indorsed thereon.

Stockholders may pay the assessment by payment of three dollars and fifty cents ($3.50) per share in cash, and by signing and filing with the Company the receipt for the extra dividend of one dollar and fifty cents ($1.50) per share, declared the 28th day of October, 1913, and have the payment of five dollars ($5) indorsed upon the certificate as paid.

By order of the Board of Directors.

A. V. R. COE, Secretary.

VOL. LVII. DECEMBER, 1913 No. 12

Important Developments in the Transportation Field

OPENING PROCEEDINGS IN THE ADVANCE RATE HEARING

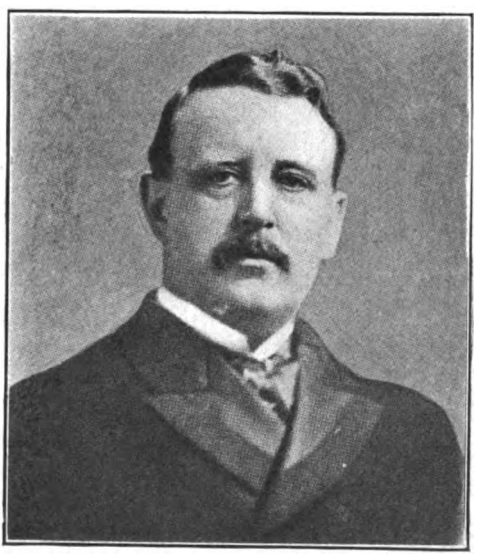
Hearings in the advance rate case through which the railways in Eastern territory hope to procure an increase of five per cent in their freight rates, were begun before the Interstate Commerce Commission on November 24th. In opening the proceedings, Chairman Clark of the Commission took occasion to pay a high tribute to Commissioner Marble, whose sudden death came as a shock to his associates.

George Stuart Patterson, general solicitor of the Pennsylvania Railroad, made a brief preliminary statement for the carriers. He was followed by Daniel Willard, president of the Baltimore and Ohio, whose carefully prepared statement supported by official statistics, plainly set forth the extreme difficulties under which railway operations are being conducted at the present time. Mr. Willard was followed by F. A. Delano, president of the Wabash, who read a statement on behalf of the Central Freight Association lines. The addresses of both President Willard and President Delano will be found reported in full in another section of this issue. Louis D. Brandeis, who has been retained as special attorney for the Commission, and the other attorneys representing both the Commission and the shippers, had nothing to say on the opening day of the hearing, it being understood that the railroads should have an opportunity to present their case in full without cross-examination.

After the statements by Messrs. Willard and Delano, George M. Shriver, chairman of a special committee appointed by the Eastern railroads to prepare accounting exhibits for the case was put on the witness stand. Mr. Shriver produced several voluminous exhibits prepared by the Bureau of Railway Economics. In addition to these, he explained that individual statements would be offered later on behalf of the Pennsylvania system, the New York Central system and the Baltimore and Ohio system, together with combined and individual statements for roads in Central Freight Association territory.

The exhibits filed by Mr. Shriver on November 24th contained the statement of 35 roads and systems, the mileage of which is about 80 per cent of the entire mileage in Official Classification territory and includes also considerable mileage which extends beyond this immediate territory. He said:

> These roads combined own 53,670 miles of line and operate 58,275 miles of line.
>
> The combined property investment at June 30, 1913, is $6,280,571,000, or $117,022 per mile of line and $58,189 per mile of all tracks. Between 1903 and 1913 these roads added to their property investment $1,980,093,000, or an increase of 46.04 per cent.
>
> The total operating revenue, which was $870,783,000 in 1903, rose to $1,424,119,000 in 1913, an increase of over $553,000,000, or 63.54 per cent. Taxes paid by these roads in 1913 aggregated $54,494,000, or 111.44 per cent more than was paid in 1903. Operating expenses, including taxes, hire of equipment and rents, increased in 1913 over 1903, $464,154,000, or 77.15 per cent, so that net operating income increased only $85,317,000, or 33.93 per cent.
>
> The per cent of return on property investment was for the five-year period to 1907, inclusive, 5.96



C. C. McCAIN.

Chairman of the Trunk Line Association, who explained the methods employed in computing the 5 per cent increase in freight rates.

Digitized by Google

per cent and for the second five-year period to 1912, inclusive, only 5.50 per cent. The average return for the ten-year period to 1912, inclusive, was 5.71 per cent and that for 1910 6.28 per cent, compared with 5.23 per cent in 1911, 5.19 per cent in 1912 and 5.36 per cent in 1913.

The total increase in expenses, 1913 over 1903, is distributed through several accounts as follows:

	Am't of increase.	Per ct. of increase.
Maintenance of way	$65,149,000	56.46
Maintenance of equipment	125,901,000	104.12
Transportation and traffic	207,827,000	64.59
General	38,490,000	144.59
Taxes	28,721,000	111.44
Total	$466,088,000	76.35

Mr. Shriver then selected the New York Central, Pennsylvania and Baltimore and Ohio systems for a separate study. These systems, he pointed out, comprise 28,395.14 miles of operated road, and 60,697.03 miles of all tracks operated, or about 47.86 per cent and 52.47 per cent of the road and the track operated, respectively, in the Official Classification territory. Their gross operating revenues for the year was $797,362,913, or 57.53 per cent of the total earnings of roads in this territory, he said. The property investment of the three systems is about $3,253,431,204. This property investment is $1,107,335,816 greater than it was at the close of 1903. Mr. Shriver explained that property investment per mile of road rose from $81,476 in 1903, to $119,275 in 1913, and for all tracks from $44,761 to $55,403.

The address said that while the property investment was increasing 50 per cent during the past ten years, the business handled, as reflected in gross earnings, increased over 63 per cent, the net operating income increasing only about 29 per cent. In other words, the return on new investment was but 3.59 per cent. He continued:

> The average rate of dividends on the capital stock outstanding was in 1903, 5.07 per cent; in 1910, 6.25 per cent, and in 1913, 5.56 per cent.
>
> As against an increase in operating revenue between 1903 and 1913, of about $309,000,000 operating expenses increased $254,000,000. The increase in total operating revenue in 1913 over 1903 is 63 per cent and that in operating expenses almost 76 per cent.

C. M. Bunting took the stand for the Pennsylvania system. He said:

> We have, comparing 1913 with 1910, an increase in tonnage, but a decrease in the average revenue per ton per mile, an increase in operating revenues of 14.03 per cent, an increase of 23.13 per cent in operating expenses, an increase of 36.53 per cent in taxes and a decrease of 13.13 per cent in net operating income, with an increase of 17.56 per cent in the property investment account.
>
> Even if the total freight revenues of the Pennsylvania system in 1913 had been greater by five per cent, the return from operations upon the property investment would have been 6.42 per cent, or only about one per cent greater than the percentage actually realized. The return from operations, even including five per cent additional, would still have been nearly $14,000,000 short of the amount necessary to give the same return upon the property as that earned in 1910, namely, 7.41 per cent.

W. C. Wishart appeared for the New York Central lines. He said:

> The New York Central Lines since June 30, 1910, have added $159,000,000 to the property which they devote to public use. The gross operating income has increased $49,000,000, net operating income has increased $3,765,590 and other income has increased slightly, and yet the whole system had in the year just closed $3,284,720 less net corporate income than in 1910. The dividends declared in 1913 were over four million dollars less than in 1910 notwithstanding the increase of $49,000,000 in the gross operating revenue.

Mr. Shriver took the stand again in behalf of the Baltimore and Ohio system. He said:

> The net operating income, which in 1903 was $24,266,000 and in 1910 $23,999,000, in 1913 was only $23,247,000. While property investment in 1913 increased $115,184,000 over 1903, and the business handled as reflected in operating revenues increased $35,151,000, the net operating income decreased $1,019,000. Comparing 1913 with 1910, while the property investment increased $56,016,000 and the operating revenue increased $13,166,000, the net operating income decreased $751,000. In other words, comparing 1913 with 1903, after increasing property investment 28.66 per cent and increasing gross business 51.56 per cent, there was actually not only no return on the new investment, but an absolute shrinkage of income of over $1,000,000 compared with what it was at the beginning of the period.

The hearing was continued on November 25th, W. C. Maxwell, general traffic manager of the Wabash Railroad, testifying as to the financial condition and results of operations of railroads in the territory between Pittsburgh and Buffalo at one end and the Mississippi River at the other, with the Ohio River at the south—or what is known as Central Freight Association territory.

Mr. Maxwell produced elaborate statistical data concerning 38 railroad companies with 31,937 miles of line, the main features of which may be thus summarized:

Results of operations for all roads in the Central Freight Association territory, while showing in 1913 a gross in-

Digitized by Google

crease in operating revenues of $78,000,000 more than for 1910, nevertheless after paying operating expenses and taxes, suffered a loss of $12,000,000 in operating income.

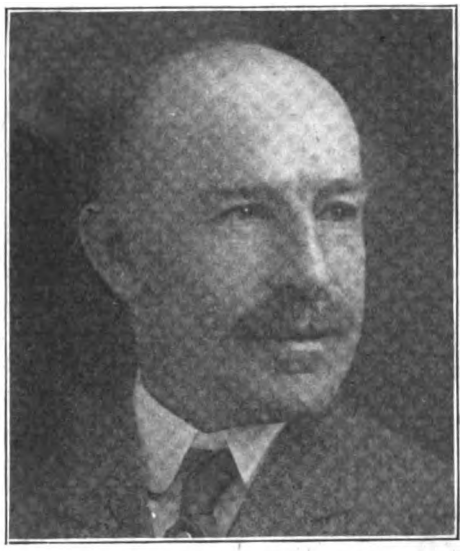
This result was due to an increase in the ratio of operating expenses and taxes to gross, as between 1910 and 1913 from 72 per cent to 78.2 per cent. This showing was made despite the fact that large sums of new capital were invested in additions and betterments. Besides the loss in net revenues for the year ended June 30, 1913, as compared with 1910, the figures for these same 35 roads for the three months of July, August and September, 1913, show a decrease in net operating earnings of $6,937,353, or approximately 20 per cent.

In addition to the tables covering figures for all the roads in this territory, Mr. Maxwell directed special attention to the condition of special groups of roads which, as claimed by F. A. Delano in his opening statement the previous day, were more particularly representative of the "whole situation" in Central Freight Association territory. This group embraces 28 roads with 23,167 miles of road, or 51.5 per cent of the entire mileage in the territory, and including such important lines as the Big Four system, Vandalia, Chicago and Eastern Illinois, Grand Trunk Western, Grand Rapids, Illinois Central, Chicago and Alton and Wabash railroads.

In 1913 roads in this group earned $63,000,000 more than in 1908, which is known as the panic year, and operating expenses and taxes were $62,000,000 more. Net earnings, after paying expenses and taxes, were only $811,000 more than in 1908. The net corporate income of these properties was actually $8,000,000 less than in 1908, although during this five-year period $180,000,000 new capital was put into these properties.

In 1913 the roads in this group earned $36,000,000 more than in 1910; operating expenses and taxes were $45,000,000 more than in 1910, and the net, after operating expenses and taxes, decreased $9,500,000. The corporate income decreased almost $17,000,000. If in 1913 the railroads in this group had been able to operate at the same ratio as in 1910, their net income, after paying taxes, would have been almost $18,000,000 greater than it was. The increase in cost is largely in two items—transportation and maintenance of equipment.

Frank H. Dixon, statistician of the Burea of Railway Economics, was called by the



C. W. MAXWELL.

General Traffic Manager, Wabash Railroad, who testified regarding the financial condition and result of operations of railroads in Central Freight Association Territory.

railroads to explain various tables which had been prepared under his direction, covering the operation of forty-nine railway systems in the territory applying for the increased rates.

These figures showed that in this territory population had increased from 36,381,000 in 1903 to 42,508,230, or 16.8 per cent, while in the same period railway freight traffic had increased 53.07 per cent. and passenger traffic 41.8 per cent. Yet new railroad mileage had increased but 6.5 per cent.

Although total operating revenue per mile and operating income per mile were greater in 1913 than in 1912 and greater in 1912 than in 1911, the increases of the two years combined have not been sufficient to bring the operating income of the Eastern railways back to the level of the year 1910. Total operating revenues per mile were greater in 1913 than in 1910 by $2,819, or 13.7 per cent, but the increase in expenses more than balanced this increase in revenue, the result being a decrease in net operating revenue per mile of $127, or 1.8 per cent, and a decrease in operating income per mile of $312, or 5 per cent.

Total operating revenues were greater in 1913 than in 1910 by $181,000,000 and operating expenses and taxes and net revenue from outside operations were greater by about $194,500,000, so that operating income showed a decrease approximating $13,500,000. This decrease took place in the face

Digitized by Google

of an increase in property investment amounting to more than $600,000,000.

Railway net return for the year 1910 represented 5.7 per cent upon capital. The 104 principal manufacturing industries of the United States show a corresponding rate of net return upon capital of 11.8 per cent, while the rate of net return for all the manufacturing industries of the United States combined was 12 per cent. Both of these rates are twice as great as the rate of return upon railway capital.

The ratio of capital stock outstanding to total railway capital securities outstanding has been falling both in the United States as a whole and in the Eastern district. The ratio of bonds is increasing.

The figures showed that the railroads, to effect more economical operation, had been constantly increasing the size of locomotives, thus enabling a greater load to be carried for each engine and train crew. Average tractive power per locomotive increased nearly thirty-four per cent between 1903 and 1912. Since 1910 there has been an increase of nearly seven per cent in average tractive power, while the annual average for the second half of the decade (1908-1912) was greater than that of the first half (1903-1907) by fifteen per cent. Increases in the average capacity per freight car between 1903 and 1912 were twenty-eight per cent. Since 1910 there has been an increase of over three and a half per cent, while the annual average for the second half of the decade (1908-1912) was greater than that of the first half (1903-1907) by nearly sixteen per cent.

C. C. McCain, chairman of the Trunk Line Association, took the stand to explain the method the roads used in computing the new freight rates estimated on a five per cent increase. The rules followed for making these rates were authorized as follows:

In computing and publishing all revised class and commodity rates in cents per 100 pounds decimals of tenths to be employed.

In figuring advanced per ton rates, fractions of one cent per ton to be disposed of by dropping 49 hundredths of one cent or less per ton and increasing 50 hundredths or more per ton to one cent.

The minimum advance in the per ton rates to be five cents per ton and one quarter cent for rates in cents per 100 pounds expressed in decimals.

In computing through westbound rates, the New York-Chicago rates will first be advanced five per cent, and other Western points taking a percentage of the New York-Chicago rate will take the established percentage of the new advanced Chicago rate, with the understanding that port differentials heretofore established and recognized will be continued.

In computing other rates not based on a percentage of the New York-Chicago rate, recognized differentials above or below advanced basing rates will be maintained.

Mr. McCain explained:

From New York, Boston, Philadelphia and Baltimore, rates are published by various differential routes, such as rail-and-lake, ocean-and-rail, and canal-and-lake, as the case may be, the rates via those routes being specified amounts under those of the standard all-rail routes. When computing the new rates, the differential relation of these several routes has been maintained as heretofore, the rates of the standard routes having been first advanced five per cent, and those of the differential routes then obtained by deducting therefrom the established differentials. This method operates to produce slight variations from the exact advance of five per cent via such routes.

E. Morris, chairman of the Central Freight Association, followed to explain the method pursued to estimate the advanced rates in his territory. It was shown that exactly the same principles were authorized as explained by Mr. McCain. The only difference was the difference in territory.

R. H. Large, general coal freight agent for the Pennsylvania, was presented to explain the methods followed in computing the advanced rates on coal. The witness asserted that the total or average advance in all the coal rates in Eastern territory as proposed by the roads is not more than four per cent.

At the conclusion of Mr. Large's testimony, hearings were adjourned until December 10th, to permit the preparation of further material and to give the Commission's attorneys an opportunity to examine into what had already been filed.

Upon the resumption of hearings on December 10th, Charles A. Conant, a noted political economist, was put on the stand by the railways to explain that the purchasing value of a dollar had decreased and what effect this had had upon the carriers.

Mr. Conant said:

Taking the receipts for freight alone per ton-mile and expressing them in mills, or tenths of a cent, it appears that the average of ton-mile receipts varied only within narrow limits during the whole of the 16 years from 1896 to 1912. In 1896, the average receipts per ton-mile were 8.06 mills, in 1912 they were 7.43 mills. This represented a decline of 63 hundredths of a mill, or about 7 per cent.

I conclude, therefore, simply as a question of mathematics, and without undertaking to enter into the intricacies of railway accounting or the special demands which have been made upon the railways, that the purchasing power of the moneys

Digitized by Google

which are now paid for freight is approximately 37 per cent less in the market for commodities than it was in 1896.

Extending his testimony to the question of the general demand for capital, Mr. Conant concluded:

Such additional capital as the roads have sought by the issue and sale of securities has been obtained on higher terms than in former years, while its purchasing power, in materials and wages, has been much less than in former years. The railways have been in the peculiar position of seeing prices rising all around them, while they have been unable to make advances proportionate to their changed relations to other industries.

If the value of the money received by the railways for the services has so seriously declined in purchasing power as to deprive them of the means of meeting their legitimate charges and obtaining new caiptal at its present rental price, they are not on an equality with other industries. They are receiving a much less proportionate share of the proceeds of the economic output of the country than that which they formerly received and they are less capable of contributing their share to equipping this country for unfettered competition with other countries in the field of production and international commerce.

The Erie Railroad system, through Charles P. Crawford, its controller, presented to the Commission a statistical statement of its own condition. The following is a summary of Mr. Crawford's testimony:

In 1913 the property investment of the Erie Railroad system had increased $88,459,748 since 1903, or 24.26 per cent, while its net operating revenue increased only $1,701,404, or 9.36 per cent and its net operating income decreased $799,205, or 4.76 per cent.

During the same period its gross operating revenue increased $19,133,219, or 39.70 per cent, showing greatly increased service to the public. The Erie system in 1913 fell $799,205 short of receiving any additional return on its great increase in investment, although it rendered a greatly increased amount of transportation service to the public. The business handled by the system has greatly increased since 1903. The number of tons of freight revenue carried one mile has increased from 5,600 millions in 1903 to 6,669 millions in 1910, 7,976 millions in 1913.

During this period the average revenue per ton per mile was 6.13 mills in 1903, 6.15 in 1910 and 5.92 in 1913. The revenue per ton mile has decreased 3.74 per cent since 1910, while the decrease in the average revenue per ton mile since 1903 may have resulted in part from changes in the character of traffic handled and in its average movement, yet it is believed the reduction in the average revenue per ton per mile has resulted in large part from late reductions.

Notwithstanding these reductions in the average revenue per ton per mile, the total operating revenue has increased from $48,000,000 in 1903 to $59,000,000 in 1910 and $67,000,000 in 1913, making an increase of 39.70 per cent for 1913, as compared with 1903, and of 13.96 per cent as compared with 1910.

Under normal conditions, with such a large increase in the business handled and in operating revenue, there should be a substantial decrease in the ratio of operating expenses to operating revenues, but this has not been the case, as operating expenses and taxes have increased at a rate largely in excess of the increase in operating revenues.

John G. Walber, assistant to third vice-president of the Baltimore and Ohio Railroad, explained the advance in the rates of pay to railroad employes as one of the largest items in the increasing expenses which the railroads have had to meet during the past three years.

Mr. Walber was a member of the conference committee of managers, representing his company in the various wage negotiations and arbitration proceedings which have been conducted in connection with increases to organized railroad employes; and the testimony offered by the witness went into the history of the movements for wage advances and the amount of money involved in the settlements, applied to the Baltimore and Ohio and other railroad companies concerned in the application for an increase in freight rates to compensate them.

Testifying on behalf of the roads in the case Mr. Walber stated that as a result of the increase in rates of pay of employes twenty-nine of the thirty-eight companies now asking $48,618,972 more for doing business in 1913 than it would in 1910 had the rates of 1909 continued on the basis of the same service.

In conclusion, Mr. Walber stated that "in addition to the wage increases granted in the calendar year 1910, a small portion of which was effective in the fiscal year ended June 30, 1910, the engineers, firemen, conductors and trainmen have been awarded increases in rates of pay through arbitration proceedings amounting to $10,350,000 a year on the Eastern railroads, and increases in rates of pay have been granted to various other classes of labor amounting to large sums in the aggregate in addition to those granted in 1910."

In order to save time Mr. Patterson did not call E. G. Hoover, statistician for the Pennsylvania, to the stand, but instead the attorney read a statement for that witness relative to the wage increases on the Pennsylvania, offering to produce the witness for cross-examination. The statement follows:

There were on the Pennsylvania system as of

Digitized by Google

June 30, 1913, 240,635 employes, and during the year 1913 the various companies of the Pennsylvania System paid to these men in wages the sum of $189,397,069. This sum represented an increase for the 1913 payroll of $18,088,637 over what would have been paid to the same number of employes at the rate of wages prevailing in 1909, showing that during those years there had taken place an increase of more than 10 per cent in the rate of pay.

The Pennsylvania System had granted in November, 1902, an increase of 10 per cent in the wages of all employes receiving less than $200 per month. Again in 1906 the Pennsylvania System awarded a further increase of 10 per cent in the wages of all employes receiving less than $200 per month. Various other increases and adjustments in wages from 1901 up to June 30, 1913 and including the two 10 per cent increases referred to, have added over $45,000,000 to the payrolls of the Pennsylvania System companies by reason of changes in rates of pay and working conditions.

The wages of Pennsylvania Railroad employes for the year ending June 30, 1913, represented an average increase in rates of pay of some 37 per cent over and above the rates prevailing in 1901.

In addition to the foregoing increases, it is estimated that the recent award in the arbitration covering firemen's wages will, based upon the amount of labor performed in 1913, add $500,000 to the payrolls of these companies. In addition to that, a further burden of $1,200,000 is placed upon these companies by reason of the changes in rates of pay and working conditions granted as a result of the award just made in the case of conductors and trainmen.

W. C. Maxwell, representing the Central Freight Committee, was recalled to the stand to offer supplemental evidence relative to thirty-six of the smaller roads in this territory.

The hearings were adjourned on December 10th, to be resumed on some date shortly after the first of the year.

As the hearings progress it becomes apparent that the railroads are presenting a far more convincing case than in 1910. Not only is their financial condition and outlook more critical than two years ago, but they have taken the pains to more thoroughly cover the ground and have left nothing to the imagination. While opposition is apparent in some shipping quarters, many of the leading business men of the country as well as their organizations, are supporting the carriers' contention, for, in the rate increases asked, they see at least a measure of relief from present unsatisfactory industrial conditions.

In the January issue of the RAILWAY WORLD will be presented a more complete statement of the important facts which the hearings have so far developed, together with editorial extracts from the press of the country showing how uniformly the proposed rate increases are being supported by leading newspapers and periodicals.

An interesting sidelight on the case is found in the addresses made on the evening of December 13th, at a dinner of the Lotus Club in New York, by Howard Elliott, chairman of the New Haven board, and Charles A. Prouty, of the Interstate Commerce Commission. Referring to the railway situation, Mr. Elliott said:

If we permit our politicians to keep on regulating the railroads and other forms of public service corporations, they will be regulated, but they also will be dead. Some day, possibly not before the millennium, the people will reach the conclusion that there are only two ways of treating railroad business. One is to treat it as a function of government, and the other is to treat it as commerce, or business subject to reasonable regulation. There is no middle ground.

It is impossible in the long run to persuade private capital to invest in railroads, if politicians and governmental bureaucrats are to exercise all the functions of ownership and management. It may be in the power of the government to destroy a part or the whole of the private capital which has heretofore been invested in railroads, on the theory that the investor must have some voice in managing his business, but it is not in the power of the government to make individuals to repeat any such foolish experiment, and they will not do it.

We all remember how nearly the silver question plunged the country into real distress. The same unthinking course toward business may produce a like result. Complaint was made at one time, that business was too much engaged in politics, but now, it can be justly said that politics is engaged entirely too much in business, and that such

J. G. WALBER,

who testified as to the effect of wage advances upon operating expenses.

LOUIS D. BRANDEIS,

the Boston attorney, who has been retained by the Interstate Commerce Commission as special representative in the advance rate case.

policy tends to take away the self-reliance and initiative of those who have done such good work in making the United States what it is.

Mr. Prouty's address which was practically a direct answer to that of Mr. Elliott's, contained the following reported significant statement:

When it is no longer possible for a railroad to spend its money save for railroad purposes, when railroads cannot buy securities of other railroads, when they cannot issue securities save with federal supervision, then, gentlemen, you can safely say that the government will permit increases in railroad rates.

Commissioner Prouty's statement combined with the known attitude of Mr. Brandeis on interlocking directorates, indicates at least one of the lines of argument which will be used by the attorneys opposing the rate advances. Now that his efficiency bubble has been pricked, Mr. Brandeis is likely to take the stand that the financial results of a five per cent increase in freight rates could be more than off-set by the saving in the purchases of supplies, fuel, equipment, etc., were they procured from independent concerns instead of from companies represented by interlocking directors. It is believed, however, that the railroads will be better prepared this time to handle Mr. Brandeis and that his arguments along these lines, particularly with regard to the cost of materials, will be met in a convincing manner by the carriers.

Commissioner Prouty's remarks gave rise to a storm of criticism in the public press. Many of the newspapers who are found uniformly supporting the Commission, deplored the fact that one of its members should apparently express so strong an opinion regarding a case not yet decided. On account of this criticism, Mr. Prouty has taken occasion to publicly deny that anything in his remarks at the Lotus Club dinner could be taken as forecasting the Commission's action regarding the application of the Eastern roads for a five per cent increase in rates. His full statement is as follows:

It must be plain that no matter what I said on Saturday night, I did not speak for the Commission. I have not studied the present request for increase of rates at all fully, and do not know how I should vote on the question if I were actively a member of the Commission. How the Commission will vote I certainly do not know, and I don't believe any of the Commissioners know. They will have hearings and investigations for eight months before they can decide.

What I did say at the Lotus Club dinner was that the railroads would have a difficult time in securing a substantial increase of freight rates, in my opinion, until they were able to show that they would use the money obtained for proper purposes. They cannot show this, I fear, until there is Government supervision of railroad securities.

My argument on Saturday night was an advocacy, in a general way, of such Government supervision. I have advocated it for fifteen years, and did not say anything new. Briefly, my position, which is absolutely unofficial, is that the railroads will always have a very difficult time getting extra money until there is positive assurance that the extra money will be used rightly, and the only way we can get the assurance is through federal laws regulating railroad securities and investments with Government supervision of them.

This has no direct bearing on the one immediate request of the railroad. I was thinking particularly of the New Haven Railroad's past history when I mentioned Government supervision. I meant to be understood as meaning that the Government wanted some assurance that the future policy of the New Haven would be different from its past, before we granted the New Haven more money. In our recent investigation of the New Haven's affairs we found records of grossly improper practices in the management of the road. We found inflated capitalization, money used for improper purposes, investments made in trolley lines, the Boston and Maine, and elsewhere that should never have been made. In fact, the powers that were did everything with the New Haven except run a railroad.

Now, what I want to see is an absolute guarantee that these things won't happen again. They are called "by-gones." What I want is assurance that they are by-gones, and won't be repeated. To my mind, Government supervision of securities, which I hope to see enacted into law at the pres-

Digitized by Google

ent session of Congress, is the only means of obtaining this guarantee. The railroads may be able to get an increase in rates under present conditions, but, in my opinion, they will have a hard time doing so. That's all I said about the present case before the Interstate Commerce Commission.

But I may say that if the railroads can show they need more money, they will get it. I can speak for the Interstate Commerce Commission sufficiently to say that the Commission has no desire to sacrifice the railroads. Let the railroads once convince the Commission that their request is just, and it will be granted, Government supervision or no Government supervision. The only point is that it will be harder for the railroads to win their case without Government supervision of securities, than with it. It is possible, but difficult.

NEW FREIGHT RATE PRIMER

Most of our readers will remember that at the time the railroads first endeavored to have the Interstate Commerce Commission favorably consider an increase in their freight rates, the New York Central Lines prepared and published a freight rate primer which set forth in a simple manner the effect of a 10 per cent increase upon various commodities between important shipping points. Another primer, of a somewhat similar character, has now made its appearance although there is nothing on its face to show that it emanates from a railway source. After pointing out that American railroads carry a ton of freight three miles for the price of a two-cent postage stamp, or in other words, at the average rate of approximately three quarters of a cent per ton mile, it proceeds to discuss in the following manner, some of the tendencies which have resulted in present unsatisfactory conditions:

It is a common practice among business men to increase the wages of experienced and faithful employes. Applied to the railroads this is all one-sided, for the reason that they have in the past and are now called upon to pay their experienced and faithful employes increased compensation, but they have stood from the public a stationary wage for many years and, in many instances, a cut. Despite the increased efficiency and added value in service provided by the nation-wide extension and expansion of our railroad systems, freight rates in the whole country have steadily dropped from one and one fourth cents per ton mile in 1880, to three fourths of a cent for several years past.

You may say, to allow the railroads to advance their freight rates will increase the present high cost of living. Will it? What relation, think you, do freight rates bear to the selling price of commodities?

The railroads now get two and two-fifths cents for carrying a pair of shoes from Boston to Chicago. If the rates were increased five per cent the freight would still be less than three cents per pair between the points mentioned. Should this affect the average selling price—$4.00 a pair?

At the present time in bituminous coal from the mines in West Virginia to the Atlantic seaboard, a two-cent stamp will pay the freight on one ton of coal over six miles.

Taking as an example, the movement of certain commodities between such points as New York and Chicago, Boston and Chicago, etc., it shows that the increased freight on one pound of sugar (1,000 miles) would be fifteen thousandths of a cent ($.00015); on a barrel of flour (1,380 miles), two and three quarters cents ($.0275); on one pound of butter (1,000 miles), thirty-eight thousandths of a cent ($.00038); on one pound of coffee (1,000 miles), sixteen thousandths of a cent ($.00016); on one bushel of potatoes (1,088 miles), one cent ($.01); on one dozen eggs (1,000 miles), fifty-seven thousandths of a cent ($.00057); on one pound of dressed beef (1,000 miles), twenty-five thousandths of a cent ($.00025).

It is pointed out that these increases while insignificant to the producer or consumer, are yet vital to the railroads if they are to be able to meet increasing expenses. Comparing the wonderful betterment in service which has occurred in the past half century, with the constant cheapening of transportation charges, the premier has to say:

This increase in service and decrease in its remuneration have resulted in a condition in which an army of more than 1,500,000 men is employed in the transportation of commodities at an average cost more than 40 per cent lower than is shown by any other country, and is paid an average wage more than 50 per cent higher than is paid in any other country where railroads exist.

Part of this continuous decrease in freight rates has been due to competition and part to operating economies. Rates have been brought down to a point where, in many instances, the carriage of certain kinds of freight is no longer profitable to the railroads. * * * A general readjustment of rates that will be more equitable to the carriers is a present necessity. * * * To be efficient, the railroads must be fairly paid. If the wages be insufficient a lack of efficiency results. This is equally true of all business enterprises.

The railroads now carry a piano 1,000 miles for $6. It costs the average householder $5 to get one moved across the street or around the block. More of these illuminating rate illustrations follow. The distances used in the illustrations are generally for 1,000 miles, although the average ton-mile haul, or journey of each ton of freight moved, is approximately 254 miles.

Railroads now carry one hammer a thousand miles for one and two fifths cents, or 54 hammers the same distances for the price of one—65 cents. They carry one pair of shoes 1,025 miles for two and two fifths cents, or 166 pairs of shoes the same distance for the price of one pair—$4.

Digitized by Google

One pair of socks is carried 1,000 miles for one seventeenth of a cent, or 425 pairs the same distance for the price of one pair—25 cents.

A suit of clothes is carried 1,000 miles for six and four fifths cents, or 220 suits the same distance for the price of one—$15. One negligee shirt is carried 1,000 miles for nine tenths of a cent, or 111 shirts the same distance for the price of one—$1. A suit of underwear is carried 1,000 miles for one cent, or 100 suits the same distance for the price of one—$1. A set of harness is carried 1,000 miles for forty-three and one-half cents, or 80 sets the same distance for the price of one set—$35. A derby hat is carried 1,000 miles for two cents, or 100 hats the same distance for the price of one—$2. An overcoat is carried 1,000 miles for six cents, or 300 overcoats the same distance for the price of one —$18. A coffee pot is carried 1,000 miles for three fourths of a cent, or 40 pots are carried the same distance for the price of one—30 cents. A typewriter machine is carried 1,000 miles for forty-five cents, or 222 machines the same distance for the price of one—$100. One pound of ham is carried 1,000 miles for one third of a cent, or 54 pounds the same distance for the price of one pound—18 cents. A cigar is carried 1,000 miles for one forty second of a cent, or 210 cigars are carried the same distance for the price of a nickel smoke.

PUBLIC STATEMENTS BY PROMINENT OFFICIALS

In the consideration of public statements recently made by prominent railway officials, it is difficult to escape the conclusion that a crisis is rapidly approaching in railway affairs. For some time past, it has been apparent that unless financial relief of a substantial character is procured, the carriers will find themselves unable to satisfactorily meet the demands of commerce.

While the tonnage has proved entirely adequate and in the main registered a normal and satisfactory growth, the economies which have been injected into its movement, including cars of larger capacity, heavier train loads, more powerful engines, reduction of grades and other operating refinements, and which have reduced the unit cost of carriage to a minimum unparalleled in the world's transportation developments, have proved inadequate to stem the tide of increasing operating expenses over which the carriers have apparently only a limited control. The costly mandates of legislative and regulative bodies, the insatiable demands of labor, increased taxes, higher cost of supplies and a constant decrease in transportation charges as the result of decisions by national and state regulative bodies, have left many railroads without adequate funds to conduct an efficient and progressive plant.

H. U. Mudge, president of the Rock Island Lines, in an address delivered on November 19th, at the 19th annual dinner of the Commercial Club of Kansas City, in discussing the railway situation, spoke in part as follows:

Everything purchased by the railways has enormously increased in price, while the price of the only commodity which they have for sale has not increased, but has very greatly decreased. Passenger fares in practically all of the Western states have been reduced thirty-three and one-third per cent during the past five years, and similar decreases have also been made in the freight rates. It is no more possible to reduce the purchasing power of the dollar in all commodities except one, and leave that stationary, or increase it in that single commodity, than it is to change the laws of gravity.

For some time past, practically all of the new money secured by the railways has been borrowed at high rates of interest and bonds issued therefor, it having become impossible to sell further shares of stock to the public at any price. We are, it is true, a nation of borrowers. The tendency is to issue bonds on which to secure funds for almost every kind of improvement, but it must be perfectly clear that this plan cannot go on indefinitely.

Whether it be a farmer, a manufacturer or a transportation company, if every dollar put into the property for improvements and betterments is provided only through the increase of the funded debt, there will, sooner or later, come an adverse year when the institution will find itself unable to meet its fixed charges, but before that time, it will find itself unable to borrow further funds, except at excessive rates of interest, if at all.

Some of the railways have already reached this point and are unable to secure funds on any basis, and others are unable to secure sufficient to take care of their needed improvements. It is as necessary for the transportation systems to put back into their properties a fair portion of their earnings as it is for the farmer or the manufacturer to do so, and this is the only possible means by which a proper transportation system can be built up and kept by private capital.

This country has the best transportation system, at the lowest rates, and operated by the highest paid employes, of any system in the world. It would still have this if a slight increase was made in the rates of transportation.

The railway stockholders of this country are made up of hundreds of thousands of all classes of our citizens. On the Pennsylvania Railroad more than one half of the stockholders are women, but I am making no plea for the stockholders—they can probably take care of themselves, and it is because I fear that they will take care of themselves and leave the railways to shift for themselves, that I am disturbed regarding the railway situation.

If private capital continues to be withheld from railway investments, as it is now doing, government ownership will be the only alternative, and while this will probably be the ultimate solution of the problem, I do not believe the country is ready for it yet. Pending the time when the people are ready for that, the splendid railway system which they now have should be kept intact and improved in accordance with the necessities of commerce, in order that when it is taken over

Digitized by Google

H. U. MUDGE,
President of the Rock Island Lines.

by the government, it will not have deteriorated so that the government will have to tax the people for its rehabilitation.

It may also be set down as a certainty that if there is no change in the conditions when the government does take over the railways, one of three things must happen—either the rates will be raised, wages reduced or the deficit will have to be made up by taxation.

Fortunately, our people have the experience of other countries to guide them. There is practically no government owned and operated railway in the world that has not increased its freight or passenger rates during the past five years and there is, I believe, more dissatisfaction among the shippers on government railways than on private railways in the same countries, or, for that matter, in any country.

The Eastern railways have asked permission to increase their freight rates five per cent, and the matter is now before the Interstate Commerce Commission. This, of itself, would not recoup them for the increases in wages that have been made during the last five years, but it would give renewed confidence; would enable them to renew purchases and improvements, and thus start manufacturing on a better scale.

There seems to be no great opposition on the part of the shippers to this increase, and it is believed by those who have the situation in hand that such a showing will be made as to justify the Interstate Commerce Commission in granting the increase. The railway "Outlook," therefore, seems encouraging.

At the bi-monthly meeting and dinner of the Pittsburgh Traffic Club, held on December 8th, Mr. Ivy L. Lee, executive assistant to the president of the Pennsylvania Railroad, also discussed some of the problems which are confronting present day railway management. An outline of his remarks is herewith appended:

A Pennsylvania Railroad officer coming to Pittsburgh feels that he is among friends. Here throbs the heart of the Pennsylvania Railroad. We operate 1,000 locomotives on the Pittsburgh division alone. Last year we spent in the Pittsburgh district $35,000,000 for wages and materials.

The railroads are confronted by menacing difficulties; wages are constantly going up; the taxes of the railroads east of the Mississippi and north of the Ohio have increased 111 per cent since 1903. Legislation is continually increasing operating expenses. Such legislation may be desirable, but it is unquestionably expensive. The railroads must find, if they can, the money with which to pay for it.

Faced with such burdens, the railroads nevertheless find extraordinary difficulties in meeting the situation by reason of numerous and anomalous factors, such as:

First: The fact that different tribunals arbitrate wage questions from those which settle what the railroads shall charge;

Second: The fact that states may impose expenses, and yet by reason of the inter-relationship between state and interstate rates, the National Government, in effect if not in act, prevents the increase of state rates to meet the increased expenses.

Third: We are constantly urged to consider business interests and to adjust our dealings to the commercial needs of the people, and yet we are often compelled by law to do uncommercial things. If a lumber dealer places a contract in Pittsburgh, relying upon a rate quoted to him by a Pittsburgh rate clerk, and it is later found that the rate was, in the utmost good faith, quoted inaccurately, the legal rate must nevertheless be collected even if it should mean the bankruptcy of the lumber dealer. This situation has been met in the Pennsylvania Public Utilities law, but is

IVY L. LEE,
Executive Assistant, Pennsylvania Railroad.

Digitized by Google

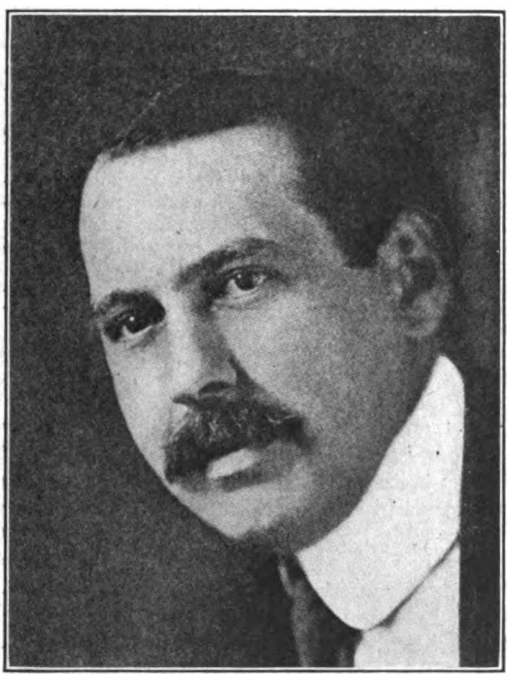
still controlling with reference to interstate shipments.

Fourth: We are compelled by the Sherman Act to compete, and yet under the Hepburn law in effect forbidden to compete with other railroads. The natural result of competition is the survival of the strong, and yet if such actual competition results in the crippling of the weak, the result is not considered desirable.

Fifth: The railroads are often between two fires, involving local interests. The city of Pittsburgh needs, and should very properly demand constantly improving terminal facilities, yet there is a certain demand here for switching between different railroads at merely nominal rates. It is sometimes forgotten that if one railroad's terminals are not to be protected, that railroad at once loses its greatest incentive to improve those terminals.

These and many other difficulties have brought the railroads to their present condition. Since 1910 the railroads in Official Classification territory, and which are now seeking to increase freight rates five per cent, have expended $660,000,000 upon their properties, and earnings during these three years have increased $186,000,000. Their expenses have increased $203,000,000, thus the railroads in this territory are to-day worse off in annual net earnings by $17,000,000 than they were for the year ending June 30, 1910, before the $660,000,000 new money had been invested.

In the Central Freight Association territory, with increased gross earnings of $78,000,000, these companies, in the last three years, have suffered a loss of $12,000,000 in operating income. The figures just at hand for July, August and September, 1913, show a loss in net earnings of nearly $7,000,000 for those three months as compared with the same quarter of 1912, a loss of nearly 20 per cent.



J. M. FITZGERALD,
President of the Western Maryland.

The result is that the railroads, as the arteries of the country, as the arteries of trade, are coming into a state of arterio-sclerosis, or hardening of the arteries, as Mr. Daniel Willard, president of the Baltimore and Ohio Rialroad, expressed the situation in presenting the case of the railroads recently to the Interstate Commerce Commission.

"In view of all this, those responsible for the management of these properties would not be justified in continuing large expenditures of new capital for additional facilities and equipment, even if such capital were available at reasonable rates of interest."

At Rochester, on December 8th, William C. Brown, speaking at a dinner tendered to the president and directors of the Chamber of Commerce of the United States, had the following in part to say:

I have unbounded faith in the future of this country, but I believe we are approaching a crisis when the influence of every thoughtful, conservative, patriotic citizen must be exerted to the utmost to stem the tide of socialism which has gained ominous strength during the past decade.

I may be wrong, but as a citizen with forty-four years of railroad experience behind me, and whatever remains of life as a business man before me I cannot but believe that government ownership of the railroads of the nation would be a dangerous mistake.

I think every conservative citizen shrinks from the experiment, but I believe the decision of the rate case now under consideration before the Interstate Commerce Commission will either substantially check or prove to be a long step in this dangerous direction.

If the moderate advance asked for is denied, in my opinion it will be impossible for the railroads to secure the funds with which to make improvements, without which expansion of the commerce of the nation must gradually come to a halt.

In this event, if it should come, the demand that the government provide funds necessary to supply adequate transportation facilities will be irresistible, and government ownership and operation, with whatever it involves for weal or woe to the nation, will be the inevitable result.

J. M. Fitzgerald, president of the Western Maryland Railway, delivered an address at Toledo on November 26th, before the Traffic Club of that City, on "Railroads and the High Cost of Living." The speaker called attention to the vast amount of money invested in railroad property and the correspondingly large amount paid in wages. In this connection he said:

Let us approach this subject, realizing that our railways employ more than seventeen hundred thousand persons, with an annual payroll of nearly thirteen hundred million dollars; that a fair value of our railway plant, equipment and property is probably eighteen billion dollars; that this

Digitized by Google

amount represents a large portion of the reserve funds of savings and insurance institutions, which administer the savings of millions of men, women and children.

As to the importance of the railroads in the development of the country Mr. Fitzgerald said: "The service most essential to the furtherance of industry and commerce is transportation; the instrumentality most important to that service in the United States is our system of railways. They supply the means by which products reach their markets and consumers reach their source of supply. In other words, they make possible the interchange of commodities. When the exchange of commodities fails, industry will also fail."

With respect to the need of co-operation in order to secure the best results on railroads the speaker declared: "The interests of the railways, their security holders, their employes, the shippers, the passengers and the public are identical. By no process of reasoning can you separate them. Therefore, we should all be concerned regarding the conditions now confronting the railways and which difficulties may be met in one of three ways."

He called attention to the fact that a reduction in wages could not be considered at this time and that any reduction in other items which would impair transportation service would not be tolerated by the public, and that the only other way is by an increase in rates. The speaker asserted that it is universally known and admitted that the railroads can not continue to meet the demands of federal and state legislation and constantly increasing wages without an increase in rates.

Mr. Fitzgerald, in a striking way, called the attention of his hearers to the following facts:

Railroad rates of compensation are under the control of the federal and state commissions. Enactment of federal and state legislation, requiring capital expenditures on the part of the railways continues. Demands for increased wages—presented by employes with increased regularity, are refused by the railways and allowed by arbitration, which is now conducted under the Newlands law—a federal enactment.

In closing Mr. Fitzgerald said:

There is nothing mysterious about the financial and physical operation of railway properties and I believe we should be frank with our stockholders, our employes, the public and the government. Take them into our confidence and make them partners in the enterprise so important to their future welfare. We will enjoy an ideal relationship with the people when they cease referring to the railroads as the "Harriman lines," the "Vanderbilt lines," the "Hill lines," or the "Rockefeller lines" and refer to them as "Our Railroads."

There is a great difference between government ownership and public ownership. I believe in public ownership and I believe in public regulation—a regulation which will protect the people from improper discrimination and insure them efficient and proper service.

Howard Elliott, on November 25th, addressed the New England Dry Goods Association with reference to the New England railway situation, particularly in its application to Boston and Maine Railroad affairs. He spoke in part as follows:

All the Boston and Maine has to sell the public is transportation at prices fixed by either state railroad commissions or the federal commission.

Those prices are fixed entirely too low for present-day conditions. But the prices are fixed, and are entirely beyond the control of the management. Some complaining stockholders say we should at once reduce all wages 25 per cent. That is a very simple statement and easy to make, but we don't control the wages. These are fixed first by the great law of supply and demand and also by the labor organizations, and now through federal operation under the Newlands Act.

Under this act employes got a raise in wages of substantially seven per cent recently, which means $350,000 a year for the Boston and Maine. About two years ago, before the Newlands bill was passed, the wages of firemen and engineers were raised.

The Boston and Maine is paying about $4,000,000 more in wages than it did six or seven years ago. I don't say that the employes shouldn't have that money, but the other conditions of the road haven't been worked out accordingly. You can't go on indefinitely keeping down the unit price and increasing expenses and remain solvent.

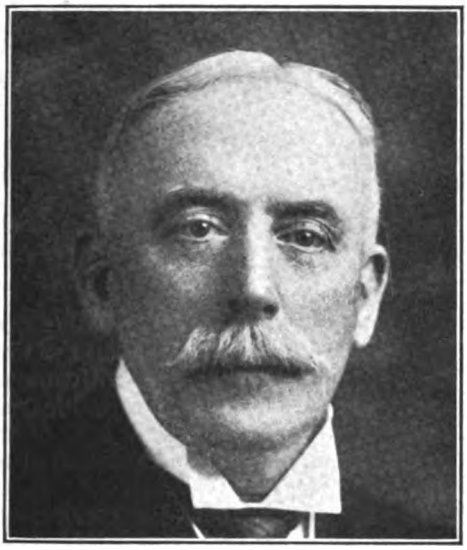
Here in New England there is a virile population, a large accumulation of wealth and great intelligence—a country rich in many ways, whose people have shown a great deal of ability in manufacturing and in educational work.

They have the power to own as good a railroad as they want. They've got to do something, because the owners and managers of this road are helpless at present. And all that is needed is a little help in raising the unit price.

A trenchant summary of the remarkable growth of the export trade of the United States with particular reference to exports of iron and steel products was the feature of an address delivered on the evening of December 3d, at the annual meeting of the Illinois Manufacturers' Association at Chicago, by James A. Farrell, president of the United States Steel Corporation. Mr. Farrell said in part:

The fiscal year ending June 30, 1876, showed an excess of exports over imports amounting to $79,-

Digitized by Google



JAMES A. FARRELL,
President of the United States Steel Corporation.

643,481. Since that time up to the present, with the exception of three years, 1888, 1889 and 1893, our exports have shown a substantial excess over our imports; the highest being in 1908, when the excess amounted to $666,431,554.

The value of exports of merchandise from the United States to all foreign countries for the twelve months ending October 31, 1913, was $2,533,570,882, showing an excess of exports over imports to the amount of $766,192,509. The corresponding figures for the twelve months ending October 31, 1912, were $2,297,317,891, showing an excess of exports over imports amounting to $519,598,954.

In the earlier periods, our exports consisted largely of foodstuffs and crude products, but during later years, our importance as a manufacturing nation has been increasing to such an extent that, out of total domestic exports during the last fiscal year amounting to $2,428,000,000, our exports of domestic manufactures amounted to $1,187,000,000, or almost 49 per cent of the total.

England has a foreign trade per capita of $125, Germany $70 and the United States $40. To European countries, export trade is a matter of vital importance, and in view of the ever-changing economic conditions which are taking place in our country, it is evident that a large export trade is, of necessity, bound up with its future prosperity. The United States must take her place even to a larger extent than heretofore among the world's nations as a factor in international trade.

While it has been generally conceded that export business is desirable and necessary to supplement domestic trade, some economists have insisted that such business should not be accepted at less than the domestic prices. No explanation, however, is offered as to the method of obtaining export business except at prices competitive with those of foreign manufacturers. It is unnecessary to argue with any one who has a knowledge of the world's export trade, that American materials cannot be sold in foreign markets at other than competitive prices for like quality.

At a recent hearing before the National House of Representatives' Committee on Rivers and Harbors on the bill appropriating $8,000,000 for Mississippi River protection, B. F. Bush, president of the Missouri Pacific-Iron Mountain Railroad system which has 3,700 miles of road in the delta district, strongly urged the passage of the bill. He said:

There is no question as to the right and duty of the National Government to make the necessary appropriation for carrying off and regulating the waters of the lower Mississippi. Louisiana and Arkansas have already expended millions in trying to control the Father of Waters and the Father of Floods. But the burden of this expense should not be on their shoulders alone. It is also the duty of the National Government by reason of the fact that the waters of 31 states, comprising 41 per cent of the area of the United States are drained off and discharged through the lower Mississippi. It is the plain duty of the National Government to make provision for its safe conduct and prevent the annual loss of life and property which falls heavily on the two states exposed to the river's ravages. In 1912, the property loss from floods amounted to $40,000,000 and in 1913 the loss was $10,000,000.

The National Government has reclaimed 7,241,000 acres of arid land in the West at a cost of $90,000,000. Last year these lands produced $181,617,000 worth of crops. In the delta district, on the lower Mississippi, there are 20,000,000 acres of the richest and most fertile land in the country subject to these floods. In 1910, there were only 3,500,000 acres of this under cultivation. Fifteen

BENJAMIN F. BUSH,
President of the Missouri Pacific.

Digitized by Google

million acres of the richest land in the country could be made available if the waters of the Mississippi could be controlled. Of the land area of Louisiana, less than 36 per cent is in farms and of this land in farms only 5,163,000 acres, or 49.5 per cent, are under cultivation. In Arkansas there are 17,416,000 acres of land in farms of which only 9,340,000, or 54 per cent, are under cultivation. Not all, but the greater part of these unfarmed lands could be available for cultivation if protection could be assured against recurrent floods. In due time this addition to the tillable area of the country could easily produce annually $700,000,000 added wealth to the country.

EXTENSION OF PARCEL POST AUTHORIZED

The Interstate Commerce Commission has approved Postmaster General Burleson's plan to extend the parcel post service. This includes increasing from twenty to fifty pounds the weight limits of parcel post packages in the first and second zones, reducing the rates in the third, fourth, fifth and sixth zones and admitting books to the privileges of the parcel post.

The maximum weight of parcels to all zones beyond the second was increased from eleven to twenty pounds. The approved changes in rates, in effect January 1, 1914, follow:

To reduce the rates for the third zone from 7 cents for the first pound and 5 cents for each additional pound to 6 cents for the first pound and 4 cents for each additional pound.

To reduce the rates for the fourth zone from 8 cents for the first pound and 6 cents for each additional pound to 9 cents for the first pound and 4 cents for each additional pound.

To reduce the rates for the fifth zone from 9 cents for the first pound and 7 cents for each additional pound to 8 cents for the first pound and 6 cents for each additional pound.

To reduce the rates for the sixth zone from 10 cents for the first pound and 9 cents for each additional pound to 9 cents for the first pound and 8 cents for each additional pound.

Serious objections to the proposed change in the rates on books and catalogues were made chiefly by mailers of heavy catalogues, but the Commission says it feels that the changes are in the interest of the public generally.

Consent was also given by the Commission to the admission of shipments of gold, gold bullion, and gold dust in Alaska and to and from Alaska in packages weighing not more than eleven pounds. The rate of postage fixed is 2 cents an ounce or fraction thereof for all distances.

In rendering its decision the Commission says:

> It seems obvious that the service to the public will be promoted by these changes, provided the revenue from the service is not less than the cost thereof. Your experience and statistics seem to show clearly that the revenue will not be less than the cost of the service.

The result of the new order, it is believed, will be to double the burden upon the Postoffice Department, while the railroads will be compelled to handle an estimated increase of from 60 to 75 per cent in the bulk of parcel post without current compensation of any kind.

It is not expected that the carriers will submit without a protest to this added burden thrust upon them by the Postoffice Department. Should any business institution dare to employ similar methods of highway robbery, it would not be long before some law would be found suitable to cover the offense. It seems incredible that public servants can sanction methods which are little short of dishonest for it is difficult to characterize developments with regard to the parcel post in any other way. Furthermore, to state that the Postoffice Department or Congress will eventually provide a remedy is not dealing fairly with the situation and it is useless to deny that whatever provision may be made for the future, the Postoffice Department stands convicted of arbitrarily forcing the railroads to perform a service for which no suitable compensation has been provided.

It is of course expected that the railroads will again urgently appeal through the Postmaster General to Congress for the earliest consideration possible of a new and more equitable basis of compensation, but the pity of it is that any public official would deliberately lend himself to a plan which deprives a vast industry and through it, thousands of American citizens, of an income rightfully theirs for services performed. A strong plea will probably be made for an annual instead of a quadrennial weighing of the mails as only by such system can the carriers be properly compensated for the heavy increases which occur from year to year.

As to the effect of the new order upon the express companies, it is too early to venture an opinion. In official quarters, the increase in weight from twenty to fifty pounds for the first and second zones is expected to

Digitized by Google

bring a large amount of new business to the postoffice and is thought may develop a large volume of the so-called local delivery mercantile business now handled by the express companies. On the other hand, the amount of new business thus brought out may fall far short of expectations at Washington for the rates now obtained in these zones have not been reduced, and as they stand, the margin of difference between them and those of the express rates, favors the latter. Considering the extra service the express companies give, together with the receipt and automatic insurance features, the preference of shippers may continue to rest with the express companies or may be rapidly regained after a better understanding is developed regarding the superior advantages offered by such companies.

A comparison of the new parcel post rates with express rates reveals the fact that as the distance increases the margin of difference between the two sets of rates decreases, while in the fifth and sixth zones express rates are actually lower than parcel post rates. In the third zone, 150-300 miles, a 20-pound parcel would cost by post 44 cents to any point within the zone limit while, by express, the same parcel would carry a charge of 56 cents. In the fourth zone the same parcel could be sent anywhere within the 300-600 mile area for 83 cents by post and 86 cents by express. In the fifth zone, 600-1,000 miles, this package would cost by post $1.23 and by express, $1.05. In the sixth zone, 1,000-1,400 miles, the charge by post for 20 pounds is $1.60, while the express rate would be $1.30.

That the railroad companies will suffer a severe loss under the increased limitations of the parcel post seems to have been recognized by the Postmaster General, who stated that he will request Congress to give the matter of granting extra compensation to the railroads its early attention, adding that his Department is busily engaged in preparing data on which Congress could erect a suitable basis for such payment.

GOVERNMENT OWNED POSTAL CARS

With reference to statements in the press that the Postoffice Committee of the House of Representatives was considering a question that the Government own railway postoffice cars instead of paying "rental" to the railroads for their use, Ralph Peters, president of the Long Island Railroad Company and chairman of the Committee on Railway Mail Pay, representing the railroads of the country, makes the following statement:

The Government pays the railroads $4,882,000 as annual "rental" for 1,353 cars, or about $3,400 per car. The steel postal car, with which all railroads must be equipped by 1915, costs about $12,000.

Postal car pay, which is about 10 per cent of the total amount paid the railroads for transporting the mails is a supplementary rate of pay to make up for the fact that postal cars 60 feet or 70 feet in length do not carry sufficient mail to reimburse the railroad company merely for the weight of mail carried. About 75 per cent of the space in these postal cars is occupied by pigeon-hole cases and sorting racks for the separation of mail en route.

Postal cars do not carry all mail over the railroads, for the railways also supply apartments in combination baggage cars. The Government, however, pays absolutely nothing for the distributing space used in such compartments unless they are of forty feet or more in length. The weight of mail carried in such compartments is very small, and therefore the major service performed by the railroads is in carrying distributing space. The aggregate space now carried in this manner in 4,029 such cars amounts to 92,866 linear feet, equal to the length of 1,548 full 60-foot postal cars. Yet for this distributing space in compartment cars, the Government makes no payment, except for the small amount of dead weght of mail carried in it.

The payment for postoffice cars, including the pay for weight carried, is about 19 cents for each mile a 60-foot car runs, whereas all other service on passenger trains pays an average of 26 cents for each mile a car is operated. If the supplementary pay for the full postal cars were eliminated, the railroads would only receive about 17 cents per mile for carrying the weight of mail as compared with 26 cents from other passenger service.

The cost of maintaining and operating a moving postoffice, with its light, heat, fixtures, carrying the necessary clerks and assuming all risks attendant thereto, constitute an annual sum fairly to be compared with the original cost of a car. If the cars were to be used merely for storage on side tracks, the rental might be reduced, but the payment is in fact for maintaining and hauling these cars an average of one hundred thousand miles per year.

I have no comment to make upon the suggestion that the Government should own its own railway postoffice cars, but such a plan cannot be favored fairly upon any plea that the railroads are now overpaid for this portion of the mail service. In fact the railroad officers of the United States feel that the companies are to-day unpaid by at least $15,000,000 for their service in carrying the mails.

In further consideration of the subject, Mr. Peters called attention to a letter written by the Postmaster General to Representative John W. Weeks on March 2, 1910, in

Digitized by Google

response to an inquiry made in regard to the cost of maintaining and operating railway postoffice cars, which we quote in full as follows:

MY DEAR SIR: In response to your inquiry made of the Second Assistant Postmaster General in regard to the cost of maintaining and opearting railway postoffice cars in its relation to the compensation received by railroad companies for the same and your reference to the speech delivered by Senator Vilas on the subject in the United States Senate, February 13, 1895, I have the honor to advise you as follows:

The department has not at this time sufficient information upon this point to give from its own records a reliable estimate. As you are aware, we have recently asked railroad companies to submit answers to inquiries with reference to the cost of operating the mail service, and it is believed that when these shall have been received we will be in a position to furnish such information. Inasmuch, however, as it may be if importance to you to have estimates made from time to time by others and such incomplete information as we have at present, I submit the following:

The cost of operating a railway postoffice car has been variously estimated (but not officially by the Department) as from 15 to 30 cents a car-mile. The average run per day of such a car is about 300 miles. Estimating the cost at 18 cents a car-mile, the total cost of operating such car for one year would be $19,710.

The specific items which constitute this total cost are not definitely known to the Department. However, as to the cost of lighting, cleaning, repairs, etc., the General Suprintendent of Railway Mail Service furnished the following estimates before the commission to investigate the postal service in 1899, viz.: Lighting, $276; heating, $365; cleaning, water, ice, oil, etc., $365; repairs, $350; proportion of original cost of car (estimating the life of a car at 15 years and the original cost at $6,000), $400; total, $1,756. Recent inquiry gives the following as the approximate cost of maintaining a car at the present time: Lighting (electric), $444; heating, $150; cleaning, $360; repairs, $300; oil and brasses, $120; interest on cost of car (at $7,500), $300 annual deterioration (estimating the life of a car at 20 years), $375; total, $2,049. These figures give the cost of a car built according to the Department's standard specifications. The cost of modern steel cars being built by some of the railroad companies is from $14,000 to $15,000.

The compensation reecived by a railroad company for operating a car and carrying the mails in it would be approximately as follows:

The pay for a 60-foot car at $40 a track mile per annum for a track mileage of 150 miles would be $6,000. The average load of a 60-foot car, according to statistics obtained recently, is 2.83 tons. The rate per ton of an average daily weight of 50,000 pounds carried over the route is $25.06. At this rate the company would receive $10,637.97 per annum for the average load of mail hauled in the car. This sum added to the specific rate for the railway postoffice car ($6,000) makes the total pay for the car and its average load $16,637.97 per annum.

Senator Vilas's argument was based upon the theory that the rates fixed for railroad transportation alone, based on the weights of the mails carried, are adequate compensation for all services rendered, including the operation of railway postoffice cars, and that therefore the railroad companies would be required to operate postal cars owned by the Postoffice Department for the compensation allowed by law for the weight of mails alone, including apartment-car space and facilities. Such theory is not justified by the facts, as will appear from the following:

A careful perusal of the debates in both Houses of Congress which led to the enactment of the present law fixing the rate of pay for railroad transportation of the mails and for railway postoffice cars clearly indicates that the additional compensation for railway postoffice cars was intended to cover the additional expense imposed upon the railroad companies for building, maintaining and hauling such cars. The companies at that time insisted that these cars, which were practically traveling postoffices, did not carry a remunerative load, and that therefore the amount of pay, based on weight, did not compensate them for their operation. This led to the specific appropriation for railway postoffice cars. In this connection it should be borne in mind that the purpose of the railway postoffice cars is to furnish ample space and facilities for the handling and distribution of mails en route. Therefore the space required is much greater than would be required for merely hauling the same weight of mails.

In regard to any proposal for Government ownership of postal cars, other facts as well as the above should be given consideration. Such cars must be overhauled, cleaned, and inspected daily. It would be necessary to either arrange with the railway companies for this service or for the Department to employ its own inspetcors, repair men, and car cleaners at a large number of places throughout the country, which would probably be more expensive than the cost to the railway companies in that respect at present. It would hardly be feasible to establish a Government repair shop. Therefore the Department would be compelled to use the shops of the several railway companies throughout the country. Without the closest supervision and attention of the Government's inspectors it could scarcely be expected that our cars would receive the same consideration in railroad shops as those owned by the railway companies. These shops are frequently congested, and it is probable that the railroad work would be given the preference.

Yours very truly,
FRANK H. HITCHCOCK,
Postmaster General.

VIOLATIONS OF THE INTERSTATE COMMERCE LAW

Representatives of the United States Department of Justice, working in conjunction with the United States District Attorney's office at New York have recently made extensive investigations of violations of Section 10 of the act to regulate commerce, which prohibits the misdescription of property offered for shipment to a transportation company when such misdescriptions are made for the purpose of securing lower than the legally established tariff rates.

The present published freight classifications of the carriers describe in great detail substantially every form and character of package of merchandise transported, and for each such package there is indicated, either by assignment to a particular class or otherwise, the rate which will govern shipments thereof. Articles which are bulky or of higher value or more likely to be damaged are so classified that the rates thereon are higher than on goods of less value and not so liable to damage and which are in such form of package that they may be more cheaply transported. Thus, hardware receives a lower rating than plated coffin trimmings or dental goods or fishing tackle, and similarly leather gloves are charged a higher rating than scrap leather, and so on throughout the entire classification, goods that would seem to be commercially analogous are differently rated under the conditions as above indicated, which are fundamental in formulating railroad freight tariffs.

These classifications are freely distributed by the carriers, and shippers are well informed as to the specifications therein affecting the goods which they ship, yet, notwithstanding this, there seems to be a desire on the part of a certain class of shippers to defraud the railroads of their legitimate charges by adopting shipping terms for their goods not in accordance with the actual contents of the packages, and by which, if same passes the carriers' receiving stations unobserved, rates lower than the lawful charges are procured.

It is with an effort to correct these fraudulent misdescriptions and violations of the law that the United States Department of Justice has undertaken its investigation. So far, the following indictments have been obtained, and in each instance the shipper has plead guilty, fines having been imposed as stated:

Henry A. Dix & Sons Co.—Describing dry goods as cotton piece goods. Plead guilty to two counts before Justice Hunt and were fined $250 on each count, making total fine $500.

Louis Lefkowitz.—Misdescribing leather goods (suit case handles, straps and suit case trimmings) as scrap leather. Plead guilty before Justice Hunt to two counts and was fined $250 on each count, or $500.

Eimer and Amend.—Scientific and chemical apparatus shipped as glassware. Plead guilty to two counts before Justice Hunt and were fined $300 on each count, making total fine $600.

H. S. Tavsanjian.—Describing oriental rugs as carpets. Plead guilty before Justice Hunt to two counts and was fined $250 on each count, or $500.

American Thermo Ware Company.—Shipping thermometers as hardware and optical goods as tools, also describing optical glass as common glassware. Plead guilty to two counts before Justice Hunt and were fined $300 on eacn count, or $600.

The American Thermos Bottle Company.—Misdescribing thermos bottles in nickel-plated cases as glass bottles. Plead guilty to two counts before Justice Hunt and were fined $200 on each count, or $400.

Joseph Fybush,of Fybush Brothers.—Dress suit cases described as leather goods. Plead guilty before Justice Hunt to two counts and was fined $200 on each count, or $400.

Edwards and Riordan.—Describing artificial flowers as millinery goods. Plead guilty to two counts before Justice Hunt and were fined $100 on each count, making total fine $200.

Tower Manufacturing and Novelty Company.—Misdescribing waste paper baskets as hardware and metal clip fasteners as hardware. Plead guilty before Justice Hunt to two counts and were fined $200 on one count and $100 on the other count, or $300.

American Bud Company.—Describing artificial flowers as millinery goods, plead guilty and was fined $300.

Camisa Brothers.—Describing artificial flowers as millinery goods, plead guilty and was fined $250.

In passing sentence in the two last cases recorded, Judge Hunt, of the United States District Court at New York, had the following to say:

I have been interested in reading of the contention of the railroads that they be permitted to raise their rates on freight because of the heavy demands for equipment, extension of systems and the increase of wages to workmen. In reading this I was reminded that the shipper must pay the rate charged for on the tariff. If the shipper does not pay the rate it is an element which in the aggregate amounts to an enormous sum which is not paid and ought to be paid.

This is one of the phases of the economic movement which has resulted in the railroads becoming honest. The situation is turning about so that the man who deals with the railroads must also be honest. It is incumbent upon the business men to study the classification of rates in which their goods fall and to conform to it. In this campaign which the Government is making those who are brought within the toils of the law at first may

Digitized by Google

not suffer so severely as those who will come later, but this will teach them a lesson.

In this peaceful revolution which is going on in business affairs the merchant as well as the corporation with which he deals must be absolutely fair and square. The higher demands of citizenship make for the ostracization of the merchant who does not obey the law. Go back to your business and think about this.

These two cases make eleven in which the Government has secured convictions in its crusade against the misrepresentation of artificial flower manufacturers and others. It is said that the Government is now investigating the cases of more than one hundred and fifty other concerns which it is alleged, are defrauding the railroads.

THE STRIKE ON THE SUNSET LINES

A remarkable example of the intolerant attitude recently assumed by railway labor and the extreme measures taken to avoid proper and necessary discipline, is illustrated by the trouble which the lines of the Southern Pacific Company in Louisiana and Texas are having with their engineers, firemen, conductors and brakemen.

The question of discipline has been causing trouble between this company and its employes for some time, and finally culminated in a strike on November 13th, in spite of the fact that the company had formally requested the Federal Board of Mediation and Conciliation to use its good offices in bringing about an amicable settlement, and had duly notified the men to this effect.

The direct cause of the strike was the refusal of the company to negotiate jointly with the various brotherhoods through co-operative committees which had been formed to handle the men's grievances in both the engine and train service. The management was willing, as it had been in the past, to confer with the representatives of the different organizations individually regarding these grievances and to confer with them jointly regarding matters of interest to them jointly, but refused to confer with them jointly regarding matters which were of interest and concern only to the individual organizations.

After remaining on strike for four days, during which time public sympathy appeared to be largely on the side of the management, and local newspapers severely criticised the action of the men, they returned to work with the understanding that the management would accept the proposal of the Federal Board of Mediation and Conciliation to meet the committee of the four unions, provided, however, that if no agreement could be reached, the entire matter should go before the Board. Just prior to the strike the brotherhoods declared that they would not concede the questions involved were a matter for mediation and conciliation, but the public indignation aroused by their attitude, evidently induced them to alter their purpose.

Now, as to the real cause which influenced the labor organizations to seriously interfere for four days with industry and commerce in that section of the country. As heretofore stated, the points in dispute pertained almost entirely to cases of discipline. As all railway men know, the lack of proper discipline has been the worst handicap in railway operations for a number of years. In many cases the men have grown to feel that their organizations would protect them no matter what difficulty might arise and while, in the public press and on the platform, the officers of such orders have vigorously denied any effort to exert an undue influence, their constant attempts to have men reinstated after the most flagrant offenses, are so numerous and so well known as to need no further comment here.

Recently regulative bodies, both state and national, have been severely arraigning certain railroads for not maintaining proper discipline and the responsibility for the lack of it has been squarely placed upon the shoulders of the carriers. It is of peculiar interest, therefore, to note the character of the offense in the cases of discipline which have caused the friction between the Southern Pacific and its trainmen and which led to the strike.

The men have sixty-seven alleged grievances, some of which have already been the cause of conferences between individual committees of the respective brotherhoods and the management. It was with regard to a number of these, which the management could not see its way clear to justify, that the labor unions by co-operative effort, hoped to bring enough additional pressure to bear to procure a more favorable result, from their point of view. The management has now made public detailed statements covering all of these sixty-seven cases. The offenses in many instances are so grave as to clearly indicate the sinister influence upon railway discipline, of an organized effort to have the penalties imposed, revoked. For example, the first case cited involves the dis-

Digitized by Google

charge of an engineer and conductor for operating a train over a bridge in the course of repair at a speed far in excess of the limit prescribed, resulting in derailment and consequent heavy loss. The brotherhoods demand these men's reinstatement with pay from date they were relieved from service. In another case an engineer and conductor were discharged because found on the main line with a light engine, in violation of rules, and on the time of a passenger train without protection, thus creating a condition which greatly endangered many innocent persons. The labor unions demand their reinstatement. In a third case an engineer was discharged on account of responsibility for a rear end collision due to gross carelessness. Responsibility of the engineer was admitted but a plea for leniency originally presented. The unions now demand his reinstatement. In a fourth case, an engineer was discharged for allowing his engine to run out of water when it was readily available by firing up the pump boiler. The investigation developed that the engineer had been drinking on the trip. The unions demand his reinstatement. In a fifth case, a conductor was discharged for failing to comply with rules, thereby causing a serious rear end collsion. The union demand his reinstatement with full pay.

Other cases include insubordination, failure to observe rules and other causes all of which, if not properly disciplined would soon reduce railway operations to chaotic conditions and endanger the lives of thousands of travelers to say nothing of other serious consequences which would follow.

It is on such a foundation, then, that railway labor of Louisiana and Texas recently held up a great transportation system and inconvenienced hundreds of travelers and shippers. It is to be hoped, under the circumstances that the road will not recede from its former position and that the whole matter will be referred to the Federal Board of Mediation and Conciliation. If such a course is pursued, we believe that railway labor, in that particular section of the country, will receive a reprimand which may induce it to take a broader point of view in future controversies of this character.

JAMES MCREYNOLDS,
Attorney-General of the United States.

ANNUAL REPORT OF THE ATTORNEY GENERAL

James C. McReynolds, attorney general of the United States, has submitted to Congress his annual report for the fiscal year. For the period under discussion it is stated that special agents of the Bureau of Investigation were engaged in investigating on an average of thirty-six complaints a month of alleged violations of the anti-trust law. It is pointed out, however, that in many instances the investigation failed to disclose facts that would justify the institution of formal proceedings. Many large industrial corporations in Mr. McReynolds' opinion, are curtailing the dangerous tendencies which would make them liable to prosecution under the Sherman anti-trust law.

In discussing the anti-trust cases decided by the Supreme Court it is stated that the plan decided upon for the severing of relations between the Union Pacific and the Southern Pacific companies, has been worked out successfully. Up to November 1, last, through conversion of the certificates of interest or of subscription receipts issued by the Central Trust Company of New York, $68,411,400 of the $88,357,000 of Southern Pacific stock transferred to the Trust Company by the Union Pacific had passed into the hands of persons who made the required affidavits.

Regarding the suits of a similar character now pending Mr. McReynolds says:

> The principle established by this decree has been adhered to in similar suits instituted during this Administration. Thus, in the suit against the Reading Company and affiliated corporations—the anthracite combination—the petition asks that

Digitized by Google

the Reading Compauy be required to dispose of the stocks of the constituent companies composing the combination to persons not its stockholders or agents or otherwise under its direction or control. My fixed purpose is to oppose any plan of dissolution which would lease the separate parts of the unlawful combination under the control of the same set of men.

With regard to conditions in New England, Mr. McReynolds has recently expressed himself to the effect that he intended to allow the New Haven's new board of control every reasonable opportunity to remedy the present chaotic conditions by financial reconstruction and otherwise rather than take the situation into the courts.

In the Attorney General's opinion, the situation in New England is of a serious character and must be corrected but he is hopeful that the present control will be able to work it out without an effort on the part of the Department of Justice to correct it by litigation. To these ends the New Haven will receive every encouragement from the Attorney General who also believes that present conditions justify great forbearance before suit is brought. In fact, it is understood that notice has been served upon the new management that if they can within a reasonable time limit, put into operation a corrective system, the Department of Justice will show them every reasonable consideration in the matter of starting litigation.

While Mr. McReynolds has adopted this attitude of forbearance in regard to the New Haven, he wants it understood that he regards the situation as distressing and that his Department is responsible to the people of that section for a prompt readjustment of transportation conditions.

Mr. McReynolds well realizes the enormous investment involved, and it is the knowledge that financial reconstruction cannot be accomplished in the wink of an eye that impels him toward his policy of forbearance. But the new board must accept in principle the ideas of the Department of Justice, and must see that these principles and reforms are soon set in force.

The Attorney General regards the selection of President Arthur T. Hadley, of Yale, to the board of directors as one of the best steps that could have been taken toward the kind of a reconstruction that will impress the people of New England with the sincerity of the new control. He said President Hadley enjoyed the confidence and respect of the great mass of the people of the section as well as of the country at large, and that his presence on the board of directors increases public confidence in the desire of the new management to bring about better conditions.

Help!

THE uniform and vigorous manner in which the press of the country is supporting the carriers' appeal for an increase in freight rates, is little less than astonishing when their attitude of only a comparatively short time ago, on this question, is taken into consideration. It shows a remarkable change in public opinion and a growing belief that the prosperity of the country depends, in a large measure, upon a railroad policy which will provide sufficient funds for the carriers to maintain and operate a progressive and efficient plant. The following from *Leslie's Weekly* is fairly illustrative of a rather belated public appreciation of the fact that an arbitrary curtailment of necessary railway expenditures will vitally affect practically every branch of commerce and trade. Furthermore, it is of interest to note that this support is coming, not from any particular political party or organization, but from practically all sources including shippers, commercial organizations, lawyers, bankers, economists and in a number of cases, public officials.

"Workers in every shop! Do *you* want the steel and iron mills to keep running? Of course you do. Then urge the Interstate Commerce Commission to give the railroads fair play. They stand ready to spend $2,000,000 *a day for the next five years*, for work and material urgently required. They cannot do it unless you help. The cost of material and wages is advancing and the income from traffic diminishing. Increase the income! Help!

"Merchants! Do *you* want your stores filled, your counters crowded, and your bookkeepers busy? Then keep the factories busy and the pay envelopes filled. This will keep your cash registers singing all day long. Help!

"Railroad employes! Do *you* want higher wages and lighter hours? Then make common cause with your employer who is fighting for a chance to live. Demand that the Interstate Commerce Commission give him that chance or let the Commission be abolished. It is your fight as much as anybody's. Help!

"Farmers! Do *you* want the best prices for your products? You get them only when wages are high, workmen busy, railroads prosperous and factories running night and day. Help!

"Workmen, merchants, railroad men, bankers and farmers! Do you all want prosperity? You can have it. Make your choice between the statesmen who build up and the demagogues who tear down. Help!

"And remember that a demagogue never filled a pay envelope."

Contemporary Opinion

The Unit.

THE following, by an unknown author, was included by B. A. Worthington, president of the Chicago and Alton, in a "Memorandum Respecting Allocation of Railroad Expenses," submitted to the Interstate Commerce Commission in a case affecting the Wheeling and Lake Erie, while he was receiver of that road. Mr. Worthington said that "while this sums up the situation in a lighter vein, yet it does so fully as accurately as has been done by any one who has had an opportunity to investigate the subject."

A ton one mile and an engine mile, and a tractive haul as well,
A loaded car and an empty car—then his eyes began to swell;
A commercial mile, a net ton mile and a gross ton mile, oh dear!
Tons and miles and trains and cars, it surely is most queer.

If we get five cents for hauling a crab from Boston's quaint old streets
To Friscotown, by the Golden Horn, what are the net receipts?
How much for coal, for wear and tear, for all the trainmens' pay?
How much dead weight does the engine haul if the crab dies on the way?

How many grades to the lineal mile, how many ties in a section?
The engine's loss and the waste of wood? Oh, is there any connection?
Oil, tallow and waste, the water supply and fuel for locomo's,
Repairs and renewals of engines and cars, goodness only knows.

How many tons to a pint of oil, how many ton miles to boot,
And ton miles to a ton of coal, as the engine goes toot-toot?
What is the total tractive power? It's as easy as A B C,
C square into S into eighty-five, P divided by D equals T.

Government and the Railroads.

(From the New York *Times*, Ind't Dem.)

IT would be useless to urge that the Government should have a heart toward the railways and other public utilities, but it ought to have a conscience. Yet the fact is that the Government graft rivals any known in the business world, and that a virtue is made of oppression and extortion practised for the good of the people. The case of the postal parcels raises the plain question whether the people wish to be receivers of goods taken from those who protest the taking. The railways claim that they are not fairly paid for service in carrying the parcels. At the same time the postoffice is claiming a profit originally placed at $10,000,000, and recently raised to $30,000,000. We believe that the people appreciate the postal parcel service enough to be willing to pay for it, and that they would support a plea for fair play. A price paid in accordance with a statute may or may not be fair. It cannot be admitted to be fair so long as those who render the service do so under duress. When profits earned in this way are said to justify the extension of the Government service to the telephones and telegraphs the outlook is nothing short of alarming for the taxpayers. When the Government runs the railways and the telegraphs there can be no more profits made by not paying bills. The bill will be paid or the service will stop, regardless of the treasury deficit.

Another example of the conscienceless attitude of the Government toward public utilities is shown by the attitude of the counsel employed by the Interstate Commerce Commission in the matter of the advance of freight rates. Mr. Brandeis proposes to use the application as a lever for reforming the alleged abuse of interlocking directorates. The railways ask to be allowed to pay their bills, and Mr. Brandeis proposes to listen when they have improved their financial methods in a manner satisfactory to him. It is as though when your tailor sends in his bill you should refuse payment because he does not live with his wife. He ought to live with his wife, and it might be that if his bills were paid he might be better able to do so. But the payment of the tailor's bills and the reform of his morals ought to be dealt with each on its own merits. Nobody would object to Mr. Brandeis's ravaging reforms in their season, but the payment of bills cannot await the process. The Interstate Commerce Commission reports this week that the railways' gross earnings for September increased $17,000,000, and the net fell $5,000,000. The railways are paid by piecework. They are indisputably working harder for less pay. They have pieced out their earnings by borrowing and spending $335,000,000 which must be paid or funded within a year if the railways are to be kept solvent. That the companies can travel this road no farther appears from the economies which they are practising to the damage of other interests than their own. The railways' contracts for rails this year have decreased seventy-two per cent, car contracts have decreased forty-two per cent, locomotive orders decreased thirty per cent, structural orders decreased twenty-five per cent. The Eastern independent steel companies are running forty per cent capacity, and the larger interests are doing but little better. It is idle to say that the railways are wilfully extravagant when they are not allowed to control the expenditure of their income. They are told how much money they must spend, and how they must spend it. They ask to be allowed to collect the money they must disburse, and they are told that they must reform their morals. They shold do whatever they ought, but they must meet their bills at the due dates. Even if Mr. Brandeis were to assist the process of giving them permission it would be months before the order were entered. Meanwhile the outlook is that the larger rates if collected will be upon a smaller volume of business.

In business not Government controlled, prices are raised when business is overwhelming and prices are lowered when dwindling business needs

Digitized by Google

encouragement. The reverse of this customary and approved practice is a novelty whose outcome is obscure. In contempt of counsel Commissioner Marble said to the *Times* that the Commission was striving to make private management of railways profitable. The next day he recalled his words, and Counsel Brandeis's utterance of stern virtue was made. This oppression of the railways is practised not because Counsel Brandeis is better than other men, or the Commissioners worse, but because of an assumed popular mandate. The people have allowed the oppression to run along on the idea that the railways were too big and rich to be damaged. The people are in the way to discover that the railways can be injured, and that the injury will recoil upon the people.

Wages and Freight Rates.

(From the Philadelphia "Bulletin.")

IF the increase in the cost of individual living is sufficient justification for the addition of seven per cent to the wages of the railroad conductors and trainmen, logically the increase in the cost of railroad living is justification for the advance of their earning power through passenger and freight rates. The Board of Arbitration on the trainmen's demands recognizes the fact that a ton of freight in Eastern territory is moved more than three miles for the value of a two-cent stamp, which is the cheapest railroad service to be found on the face of the globe, but it ignores that fact in its recommendations, because it is forced to admit that labor couldn't live on wages based on that rate. Obviously, if existing freight rates are not adequate to provide a living wage for labor, they cannot provide living income for the railroad operators.

But the Board of Arbitration "passes the buck." The question of rates, the problem of the railroad's living, belongs to the Interstate Commerce Commission, which stands as a challenger of every proposed increase of rates, suspends the new schedules for six months and employs Mr. Brandeis to use whatever resource may be at his command to controvert the railroads' plea. The finding of the Board of Arbitration is binding on the roads, and it ought not only to be accepted without challenge by the Interstate Commerce Commission but it should prompt them to immediate action on the rate advances. The increased wage schedule is retroactive and dates from the first of October, but the increase in rates which is to provide for these additional wages must wait the pleasure of the Interstate Commerce Commission and its proposed muckraking investigation.

Ending the Business Uncertainty.

THE Baltimore *Sun* of December 4th, contains a stirring editorial under the above caption, in which it quotes with approval the statement made by President Wilson in his recent message to Congress to the effect that "it is of capital importance that the business men of this country should be relieved of all uncertainties of law with regard to their enterprises and investments and a clearer path indicated which they can travel without anxiety."

The *Sun* points out that uncertainty does more harm to business than almost any other one thing, and in this particular declares that "uncertainty with regard to the railway situation has a tremendous depressing influence at this moment. The railroads will not spend money until they find out whether or not they are to get the increase in freight rates which they ask, and business men will not take any important steps until they know what railroad service they are going to have in the near future."

After discussing other developments which are more or less responsible for the present conditions of uncertainty but which in the *Sun's* opinion, particularly with regard to the tariff and currency legislation, have been inevitable and necessary, the railroad situation is again referred to in the following manner:

"Yet after allowance is made for such measure of uncertainty as is necessary and inescapable in these connections there remains a large amount of it that can be removed by prompt and frank action on the part of the Administration, Congress and the Interstate Commerce Commission. And upon such action probably depends all the difference between an immediate revival of business and a long-continued period of depression.

"We have included the Interstate Commerce Commission in the list of those from whom prompt and frank action is demanded, because we strongly believe that the most important step of all toward immediate business prosperity is the granting of the request of the railroads for increased freight rates. We have many times stated our reasons for this belief, but at this time will only mention one fact, one brought out at the recent hearing before the Interstate Commerce Commission. Since 1910 the Pennsylvania Railroad has increased its property investment by $207,000,000. The net income, however, instead of keeping pace with the enlarged investment was actually $11,000,000 less in 1913 than in 1910. Nor was the Pennsylvania Railroad an exception. During the three years in question all the roads included in the number which now ask an increase of rates added $659,000,000 to their property investment, but the net income of all of them was $16,000,000 less in 1913 than in 1910. Explain this as you will, no one is going to invest in railroad properties so long as this situation continues. Yet until the railroads do get the money to enable them properly to take care of the business that is offered them there can be no revival of business. This is fundamental."

Favor Higher Freight Rates.

E. W. BEEDLE, president of the Henry O. Shepard Company, of Chicago, in an article in a recent edition of the *Inland Printer* favors the five per cent advance in freight rates asked by the steam railroads of this country. He believes better service will result and that an advance in rates will be in the interest of general prosperity.

Mr. Beedle addresses himself in particular to business men connected with the printing and publishing trade. He points out that the proposed advance is favored by chambers of commerce in St. Louis, Cincinnati, Baltimore, Pittsburgh and Philadelphia.

Mr. Beedle asserts that the conditions surrounding the higher freight rate movement at this time are considerably different from what they were in 1910. "Shippers," he says, "two years ago protested mainly on two grounds—first, that the

Digitized by Google

carriers could not show their need of greater revenue, and second, that the proposed schedules would not fall equitably on the several classes of traffic. Industrial executives also complained that the managers had not conferred with them before filing advances. This year all three of these conditions seem to be met.

"Business men understand that in order to increase plants it is necessary to raise new capital and that surplus earnings are required as a guarantee that a return can be paid on additional stocks or bonds," says the publisher. "Business men cannot afford to have the railroads of the country fall into a situation where augmentation of rolling stock, road and terminals is retarded. Poor service would be a greater injury to the shippers than they would suffer from any increase in rates which the Commission is likely to sanction. Railroads, too, with their vast purchases and payrolls, are an enormous factor in national prosperity. Every interest gains when the roads are vigorously carrying out projects of importance."

Business Dependent on Rate Action.

J. S. BACHE AND COMPANY, discussing the business outlook, say:

"Immediate relief for the business situation, as we have again and again asserted, depends upon the action of the Interstate Commerce Commission on the request of the railroads for increased rates. There is said to be a growing belief among shipping authorities that the roads will be allowed some advance, not possibly the five per cent horizontal increase, but more or less, as the Commission may figure out the needs in different directions. That some increase will be allowed, it is said, is being nearly taken for granted, but the long, drawn-out proceedings of the Commission would not, at the earliest, come to a conclusion until, the railroads think, some time in April, which leaves a long winter of discontent, with the army of unemployed liable to be constantly added to. It is already reported that one railroad is planning to let out 10,000 men. Perhaps this is the only remedy, though a hard one, for the unwisdom of politics. Politicians have been piling up restrictive laws and forcing from corporations much more than is just and even more than is safe. But when they hear from the great body of laborers who furnish the votes, more heed will be paid than heretofore."

The Railroads' Additional $6,000,000 Burden: Who Will Pay It?

IN a recent weekly news letter, the banking house of Hambleton and Company, of Baltimore, discusses the recent decision of the arbitration board by which the Eastern trainmen were awarded a $6,000,000 increase in wages.

If, as the committee, in allowing the increase says, the cost of living has advanced greatly in the past few years and therefore the trainmen are vitally affected, how much more so are the railroads? The steady declining net revenues of many of the roads coupled with the almost prohibitive terms upon which they have been obliged to market their securities, is a matter of serious consideration. The cost of railway labor has increased enormously during the past ten years, while everything else that enters into the operation of a modern transportation line has advanced anywhere from 20 per cent to 50 per cent.

To quote from the letter referred to:

"We are all of us directly or indirectly dependent upon the prosperity of our neighbors in direct proportion as a neighbor is in big or little business, a large or small consumer. The largest industry we have in this country is agriculture, and incidentally the farmers constitute the largest consumers of money, labor and manufactured goods. The farmer now is prosperous throughout the country, due to the abundant crops and the advanced prices received for his produce. Our next largest business is railroading, and it is unquestionably true that their income over expenses does not show the margin that indicates prosperity. Is it not reasonable that this condition of our second largest business is in a great measure responsible for the stagnation in finance and commerce throughout the country?

"The public, heavily interested as it is and must be in the welfare of the country and the continued prosperity of its people, should realize that the railroads must be kept up to standard in order that facilities may keep pace with shippers' demands. It, however, would be idle to say that there is not abroad in the land a spirit hostile to any move which would mean increased revenue to the roads, and it should now be the duty of those who hold that point of view to study the matter with care and with an eye single to the country's good, not biased by personal animosity toward corporations seemingly wealthy and prosperous. The increase of freight rates does not mean that the railroads are to be allowed to dip at will into the pockets of shippers and extract therefrom sums sufficient to meet any deficit caused by the increase in labor, maintenance and operation. What it does mean is that the transportation companies be allowed to increase, fractionally, their freight charges, so that a proportion of the aggregate receipts therefrom will meet the increasing burden which is now placed upon the carrier.

"The result of a five per cent increase straight along the line would not, so far as individuals and shippers are concerned, amount to a great deal over the present rate, but it would be the million fractions of a cent which would enable the railroad corporations to maintain a factor of safety in earnings sufficient to take care of the overload of labor and material charges. If, under the award, the carriers must annually expend six million dollars more than they have for labor, how long will it be before the railroads are in a position where they will be unable to meet their obligations by reason of the continued additional drain upon their resources, with no correspondingly increased source of revenue to supply such demand?"

Some Possible Results of Government Ownership.

(From the *Santa Fe Magazine.*)

WHAT effect would government ownership have upon American railroads and railroad men?

Well, in the first place, it is against the law for government employes to lobby for more pay or better working conditions. Railroad employes would find themselves unable concertedly to influ-

Digitized by Google

ence legislation in their own behalf. They would not be foot loose in that respect, as at present. Nor would they find it as satisfactory to deal though the Interstate Commerce Commisison or a special board of non-political arbitrators—even if they could deal at all, which is doubtful, for:

The government refuses to recognize as such any brotherhood, union or association. Railroad employes would work on the same basis as do employes in the government printing office, engraving bureau and letter carrying service. The open shop is the avowed policy of the government, which, according to the viewpoint of the individual thinker, is a good or bad feature.

No pension is allowed the government industrial employe. In this feature privately owned railroads are away in the lead over any other industry. Millions yearly are spent by railroads in pensioning faithful employes. In this they are pointing the way to the lagging government authorities.

Any employe cannot sue the government if injured. Thousands of federal employes yearly are injured in service, and of these but few are compensated. In railroading, every effort is made to give suitable employment to a crippled employe, besides which he is properly recompensed for injuries sustained, compensation varying according to whether the employe was partly to blame or not. In any event, if not satisfied the employe is at liberty to sue for what he believes his due. Doctor Rubinow reports 17 fatalities and 124 injuries in the rural mail delivery service, and 8 fatalities and 440 injuries in city mail delivery, for none of which did the government pay a cent in compensation. Altogether he mentions 1,600 injuries, 390 of which were fatal, without compensation to anyone. If that happened in railroad or other industrial service, think of the bedlam in Congress with a thousand tongues all trying at once to voice excoriations and anathemas.

Politics would rule under government ownership. Pull rather than ability would be the password, for the more important executive positions would not be under civil service regulations. This would result in the decline of the personnel of railroad officials, and subsequently of the men. Instead of officials being chosen by the representatives of vitally interested stockholders, who would demand the employment of the best officers obtainable, the better salaried railroad positions would be political plums to perpetuate in office the ruling party, just as patronage is dished out in the customs, excise, postoffice and other service. Employes could not be expected to continue loyal to such men, drawing larger salaries but knowing less about their work than the men under them.

Every railroad man at present takes pride in the high standing of railroad men as a body, and it would be bitter to him to see that standard lowered.

To cover the results of inefficient management, rates could be raised at will, or any political party in power fearing to raise rates, yet wishing for political purposes to show a surplus, would curtail necessary maintenance expenditures. The results of such a policy would not be apparent until some years later, when the country would pay dearly for rehabilitation. This is the history of government owned roads in other countries.

Arthur T. Hadley says in *Harper's Magazine*: "State railroad ownership too often means not the ownership of the state as a whole but of a small body of men who happen to hold political power at the time. It is neither more nor less than the substitution of a ring of political managers for a ring of railroad managers."

Dr. Jacob Gould Schurman, president of Cornell University, recently expressed the view: "In the United States the central government possesses under the Constitution a minimum of governmental functions. Yet even among us the public business is conducted with much less energy and efficiency than private business. Although some European states own and manage the railways—never, however, with great success—we hesitate to invest our government with this function because of its incompetency as a business agent and the inefficiency to which it is doomed by partisan politics."

Following is an extract from a letter by the Hon. Evelyn Cecil, M. P., on the railway nationalization question in Great Britain: "The Western Railway of France, with its enormously enhanced deficit, its greater inefficiency of operation and the insubordination of its staff since it has been taken over by the state are now notorious. The whole process of nationalization in Italy was accompanied by widespread strikes, and in one case the appointment by the government of a most capable officer was directly afterward canceled, apparently on the ground that this highly reputed expert was objected to by the men as too strict a disciplinarian. It has been charged in the Canadian parliament that during political campaigns the government increases the number of employes on the Intercolonial Railway (which is under government management) to influence election results. The Intercolonial Railway of Canada has accumulated an $80,000,000 deficit to be borne by the Canadian people."

A number of European countries, particularly Austria and Denmark, have raised their rates substantially to cover the losses sustained under inefficient governmental operation, and in Denmark the capitalization of the railroads has increased 27.13 per cent within the last five years, while the mileage has increased but 1.94 per cent.

Under political control railroad building would be carried on where the parties in power locally or nationally should decree it should be done, rather than where the possibilities of industrial development reasonably would warrant the construction of new lines. The same policy would be pursued with reference to railroad development as is pursued in connection with the construction of postoffices and other public buildings—the Senators and Congressmen would pull for the selfish welfare of their districts, regardless of the best interests of the country as a whole. This is shown in the erection of beautiful marble postoffices and other government buildings in unimportant municipalities. In return for support in securing the erection of such buildings or in carrying out other pubilc works, the lawmakers whose political welfare is affected thereby trade their support for unwarranted expenditures in the districts represented by other lawmakers. And there you are. A complacent public foots the bills. The pork barrel and log rolling would be the *modus operandi* of government ownership of railroads.

Though bids would be asked for railroad supplies, inevitably the great bulk of purchases would in time go to comparatively few concerns. This

Digitized by Google

would be the natural sequence. Rarely are two manufacturers' goods of exactly the same quality, and on the pretext of quality certain concerns could through political influence or at the caprice of one or two people in charge of purchases, procure all the business in their respective lines. Then, instead of having a great many concerns of various financial standings furnishing the various railroads, we should have a few great industries with their branches practically monopolizing the entire railroad supply business. Nor would heavy freight shipments over certain lines be instrumental in the different manufacturers getting at least a portion of the business, as is now so commonly the case. All the roads would be owned by the government, and it would be immaterial to it which roads any shipper used—the shipper would have to ship, and all the money would find its way into one coffer anyway.

Those in executive positions of the greatest importance, as well as those under civil service, would hesitate about making changes in organization, installing labor-saving devices or instituting new methods when, continuing in the old way, they would be free from criticism, whereas if they sponsored any innovation which did not operate successfully they would be targets for censure by the political opponents of the party in power, and they would be told to cease being so openly active or their jobs would be the forfeit—resulting really in serfdom and penalizing initiative. This would be greatly in contrast with conditions at present, for in no other industry is progress so exemplified as in railroading, and no other industry claims so many master minds.

The government, through its agent, the Interstate Commerce Commission, always is prone to hold the railroads strictly to account in the matter of prompt compliance with its demands for reports and statements. Yet how does the Commission carry on its own work in this respect, hampered, as it is, by being under government control? Here is an example: Monthly reports of earnings are made by all railroads. The Interstate Commerce Commission calls for these reports, made out on special blank forms which it supplies the railroads. The consolidated report issued by the Interstate Commerce Commission is, it easily can be understood, something of great interest to those having heavy railroad investments as well as to financial publications and others. It therefore is aimed to have this report out each month as speedily as possible. Then what must one think when he learns that the blanks on which the July reports were to be made out were not sent out until the middle of September instead of the middle of July? It merely shows that the printing of the most important blanks sent out by the Interstate Commerce Commission was delayed two months while the political speeches of Senators and Congressmen were being rushed into pamphlet form and franked broadcast to serve the interests of these gentlemen. There is no need of going on and reciting thousands of other instances of the deleterious effect of politics upon business under government control. But on the theory that the king can do no wrong it is considered perfectly proper for government agencies to conduct their affairs in this manner.

Government ownership of railroads is not so improbable as some people think; and those most active in securing it will be railroad directors having at heart the proper interests of the stockholders they represent. One readily can perceive a reason for this when he remembers that in the fiscal year 1912-1913 the gross income of the railroads increased $384,000,000 over those of 1909-1910, while the net income increased but between three and four million dollars. And don't forget there were over ten thousand more miles of railroad in 1912-1913 than in 1909-1910. Does anyone believe that to be good business? Would any American merchant or manufacturer feel happy over such a ratio in his business? It means the railroads did $1,000 more business on a greater invested capital to net but $10. That is too narrow a margin for safety. The slightest caprice of fate or fortune would wipe it out and create a material loss.

Railway Valuation.

THE November issue of the *Engineering Magazine* publishes an unusually interesting and comprehensive article on the indirect results of national railway valuation, by J. Shirley Eaton. After outlining how serious and how manifold are the problems involved in the public valuation of railroads, Mr. Eaton concludes his article as follows:

"Railroad valuation undertakes to apportion to each thread in the intimate weave of the railroad fabric a justifiable—a legal—value. The work is complicated and precise; it deals in epitome with large principles, and its items group forward into the totals that are to make or mar our railroad credit. Mr. Lincoln was once asked how long a man's legs should be. The inquirer had worked out elaborate formulas on which to base the answer, Mr. Lincoln thought profoundly for a minute and then replied, 'Long enough to reach to the ground when standing.' There are nice questions to be solved; an unthinkable amount of detail to be accomplished in order to value the railroads of the United States. But when all is done, the legs must be long enough to reach to the ground when standing—the allowed valuation must so satisfy present investors that it offers the conditions which will attract future investors. Government may fix the limits of confiscation on the one hand, and of extortion on the other hand, but if it interferes too much in the adjustments of what should be worked out naturally between these limits, it will impose inflexible conditions, destroying expansive adaptability—and the result will be paralysis.

"A valuation which places its emphasis on cost of reproduction of physical parts runs to an appraisal upon the cost basis of the service rendered by the railroad, and lends itself to a theory of regulation which is unfair because it is illogical. In so far as the administration of the law leans to an emphasis on the physical valuation at the expense of the intangible elements of value, his Domesday of American railroads will fail in the large constructive results which the powers and wide discretion vested in the High Commission would lead us to expect. Instead of opening the way to a large expansion, the valuation undertaking may only serve to mark the passing of an era of unprecedented development, even if the development has been at times misdirected. It cannot be stated too emphatically that the function of regulation, of which this valuation is intended

Digitized by Google

to be a determining factor, is merely to hold in co-ordination the competitive forces, eliminating the destructive competitions and stimulating the productive competitions with an eye single to the largest social efficiency."

In the course of his article Mr. Eaton presents a definition of regulation which is surely worthy of the serious consideration of all those who are interested in the proper development of the country's transportation systems. He says:

"Regulation should result in creating more and always more joint profit. Its whole and only real function is to hold in co-ordination and in equal and fullest play *all* the constructive forces, *both of railroads and industry.* This it does by performing its function of eliminating the obstructions to team play which cross purposes, unfair methods, strategic interruption of free action, always set up."

As compared with the present day regulation in which personal or political motives wield such an important influence, it is hardly necessary to state that a regulative policy based upon such an ideal principle, would be accepted most gladly by the sorely perplexed and harassed railway managers.

In another statement Mr. Eaton suggests that perhaps the valuation of railroads may be but the entering wedge for their government ownership, which, in turn, may extend itself to the government ownership of the plants of production and so project us at last into the full realization of socialism

While this is a far call into the future, such ultimate development is by no means improbable in view of the trend of recent political activities.

The Case for Increased Railroad Rates

OPENING STATEMENTS BEFORE THE COMMISSION BY DANIEL WILLARD, PRESIDENT OF THE BALTIMORE AND OHIO RAILROAD COMPANY, AND F. A. DELANO, RECEIVER OF THE WABASH RAILROAD.

ON November 24th, the Interstate Commerce Commission began its consideration of the petition filed by railroads in Official Classification territory for permission to increase their freight rates five per cent. Judged by the manner in which the daily press is reporting and discussing these proceedings, it is receiving a nation-wide attention and the expressions in favor of such increase so far outnumber those against it, as to point to an overwhelming popular sentiment in its favor.

On the opening day of the hearing, President Willard, of the Baltimore and Ohio, and Receiver Delano, of the Wabash, made the opening statements in support of the necessity for the increases requested. Mr. Willard who is chairman of the Committee of Railroad Presidents, appointed to present the railroad case to the Commission, spoke as follows:

DANIEL WILLARD.
President, Baltimore and Ohio Railroad.

"The railroads, parties to this proceeding, include practically all the lines operating in so-called Official Classification territory, which is substantially all that part of the United States east of the Mississippi and north of the Ohio and Potomac rivers. The same companies were also parties in a similar proceeding before this Commission in 1910.

In its report of that investigation, known as I. C. C. 3400, the Commission made a comprehensive review of the whole subject and found that the carriers had failed to establish the need of additional revenue from increased rates at that time. It recognized, however, that it might come about in the future, as the carriers feared, that the net earnings from the then existing basis of rates would be inadequate, but held that this could only be determined by an actual test. It said: 'If actual results should demonstrate that our forecast of the future is wrong, there might be ground for asking a further consideration of the subject.'

"Since 1910 sufficient time has elapsed to afford the actual test, and with the records of operation for the three intervening years available, the same carriers appear again, believing that the results of the actual test will now demonstrate the necessity for additional revenues or net earnings.

"In I. C. C. 3400, page 19, the following language is used:

> Our railroads must be maintained in a high state of efficiency. This the public interest demands. Commerce and industry cannot afford to wait on transportation facilities. Our rates should be such as to render possible a high-class, not an extravagant service.
>
> It is generally conceded that within the next few years, if our means for transportation by rail are to keep pace with the calls upon them, very large sums must be expended in the way of new construction and new equipment. While some small portions of this may come from current earnings, the great bulk must be new capital. This capital must be obtained from the investing public.
>
> If, therefore, we are to rely on the future, as we

Digitized by Google

have in the past, upon private enterprise and private capital for our railway transportation, the return must be such as will induce the investment. It is therefore not only a matter of justice, but in the truest public interest that an adequate return should be allowed upon railway capital.

"While the carriers fully recognize and acknowledge their obligations to the public, and are alive to the responsibilities so imposed, they are helpless to fulfill these obligations, unless the financial result of their operation is such as to inspire the confidence of private capital and encourage the support of private enterprise, and the result of operation during the last three years is not such as to inspire the one or encourage the other.

PROBLEM NOT MERELY OF DIVIDENDS.

"This as we view it is the situation to-day, and if we are right, it is respectfully submitted that there is at this time no more important question before the people, nor one the correct solution of which will do more to stimulate healthy commercial activity and promote industrial growth. It is a mistake to think that the problem is merely a question of dividends to railroad stockholders, although that feature is of course involved. The problem in a broad and true sense affects all interests, and the outcome of this particular case —whichever way it is decided—will mark an epoch, because it will, in effect, very largely determine whether we shall as in the past continue to look to private capital and private enterprise for our transportation requirements, or be compelled finally to accept the only alternative possible. It is recognized, of course, that railroad expansion and improvements must go on, and any tendency or condition that threatens to seriously check, if not completely stop such expansion in a large and important part of the United States, becomes, because of that fact, a matter of vital importance.

"This Commission in its report, I. C. C. 3400, said that the railroads had failed to establish a necessity for higher rates at that time. It also said, in effect, that it believed that from the increase in gross earnings which would undoubtedly come to the railroads, together with such economies as the companies might effect, the net earnings of the future would be adequate, but it also said that should it come about that its views were not sustained by future developments and should it appear at any time that there was a real necessity on the part of the carriers for increased revenue, in order that they might be in position to provide such facilities as the public required, that it would, upon request, give the matter further consideration.

NET EARNINGS DECREASING.

"During the first two years immediately following the decision, the commerce of the country showed little, if any, change in volume, but during the last fiscal year there was a marked activity in business of all kinds, and the gross earnings of the railroads generally for the year ended June 30, 1913, were the largest in their history. Notwithstanding the increased gross, however, the railroads in Official Classification territory continue to show decreases in net earnings, and as the Commission well said in the opinion above referred to, 'It is the net, not the gross, we must consider.' This decrease in net earnings has been due largely to greatly increased expenses, as pointed out in the petition which the carriers filed for rehearing on May 14, 1913, from which I will quote:

The cost of conducting the business of the carriers has been, and is being, steadily increased by increases in capital charges; increases in wages, in taxes, by burdens imposed by legislative enactments, such as extra crew laws, employers' liability and compensations acts, by the elimination of grade crossings, either in part or in whole at the expense of the carriers, and in various other respects, and it is felt that existing rates are insufficient to afford just and reasonable compensation and return to the carriers, and are unreasonably low in view of the value of the service afforded thereunder.

"In the application for rehearing, just referred to, the carriers asked permission to advance freight rates in Official Classification territory on the basis of five per cent, with reasonable minima and with the modifications necessary to preserve differential relations. The Commission thereupon ordered that this proceeding of inquiry be instituted into the following matters:

First, do the present rates of transportation yield adequate revenues to common carriers by railroad operating in official Classification territory?
Second, if not, what general course may carriers pursue to meet the situation?

"The railroads, parties to this proceeding, have prepared new tariffs, advancing freight rates as suggested in their petition, and have placed the tariffs on file with this Commission and at stations, so that all concerned might be fully advised regarding the effect of the proposed increase.

"In order to develop the whole situation and to show the actual operating results obtained during the last three years, tables have been prepared, containing such information as is necessary to show the changes that have gradually come about in property investment, earnings, cost of operation, income, etc., not only during the three-year period, but also for the last ten years. This has been done because the influences which have brought about the existing conditions have been operating over a considerable period of time. The present situation, and the gradual but consistent tendency in that direction are both clearly indicated in these tables. Separate tables have been prepared for each of the several companies for the periods above mentioned, and a combined statement giving the consolidated figures for all of the companies has also been prepared, and all of the tables havs been or will be filed with the Commission.

THE INCREASED INVESTMENT.

"A brief reference to some of the more striking features in the statements may be pertinent at this time. The consolidated statement shows, for instance, that during the fiscal years ended June 30, 1911, 1912 and 1913, the railroads interested in this movement increased their property investment $659,862,000. The gross earnings of these roads during the last fiscal year were $1,424,119,000, or $186,775,000 greater than they were in the fiscal year ended June 30, 1910.

"The operating expenses and taxes during the last fiscal year, for the same roads at $1,087,365,000 were $203,087,000 greater than they were in 1910; so that even though these railroads earned in gross during the last fiscal year $186,775,000 more than was earned three years previous, the net result, after paying operating expenses and

Digitized by Google

taxes, was actually $16,311,000 less than it was in 1910, notwithstanding the fact that over $659,000,000 of additional money had been spent in the meantime for additions, betterments and equipment. These companies apparently not only failed to earn any return whatever upon the new capital invested, but saved even less from gross earnings, as return upon the original property investment, than they were able to show before this large additional expenditure was made.

"Another table has been prepared showing the combined results, for the same period, of the Pennsylvania, New York Central and Baltimore and Ohio systems, these particular companies having been referred to by the Commission in report I. C. C. 3400, as typical systems. This table shows that on these three systems during the three-year period mentioned, the property investment was increased $423,431,000. The combined gross earnings during the same period increased $109,380,000, while net operating income of all three systems, after paying operating expenses and taxes, was $8,380,000 less in 1913 than in 1910, notwithstanding the fact that over $423,000,000 had been spent in the meantime for betterments, additional equipment, etc. I might also add that in the single case of the Baltimore and Ohio System, the tables show that the property investment of that company was increased over $56,000,000 during the same three-year period; the gross earnings in the meantime increased over $13,000,000, but the net operating income in 1913, after paying expenses and taxes, was $660,000 less than in 1910.

New Capital Earned Little or No Return.

"The separate reports of the roads or systems which will be submitted show that the same tendencies have operated in greater or less degree in the case of each individual company. In brief, it appears to have come about that the new capital invested in railroads in Official Classification territory, during the last three years, has earned little or no return; in fact, these properties generally are actually earning less net, after paying operating expenses and taxes, than they were earning at the beginning of the period, and before the $659,862,000 had been spent. It would seem that the mere statement of the case should be sufficient to indicate the serious situation which confronts not only the railroads in this territory, but also those industries and commercial undertakings which depend upon the railroads for transportation.

"The result, as might be expected, of this constant tendency toward diminishing net returns, has been to seriously check, if not altogether stop, the normal development of railroad facilities in the territory affected. The tables show that during the ten-year period these railroads found it necessary to increase their property investment approximately $2,000,000,000, an average of about $200,000,000 per annum, and it is certain that an equal if not greater amount per annum will be necessary to meet the requirements of the future.

"Railroad managers would hardly be expected, under the circumstances just stated, to continue large capital expenditures for betterments and additions, if possible to avoid doing so, at least unless they had reason to believe that something had happened, or was about to happen, which would materially change the situation. It is believed that the preceding statements, if confirmed, are sufficient in themselves to justify the request which the carriers now make for advanced rates, unless it can be shown that the causes which have operated to bring about such results are of a temporary character, or have now ceased to exist. As already stated, while the matter has only recently reached an acute stage, the influences which have as a whole served to bring about the present condition have been operating for a number of years. Evidence will be submitted to show some of the contributing causes and their effects It was shown in case I. C. C. 3400 that the advanced wage movement culminating in 1910 would increase the wage payments of the railroads in this territory approximately $34,000,000 per annum. The Commission, in its report, expressed the opinion that in view of the large recent increases, it seemed fair to assume that wages would not much increase in the immediate future. Evidence to be submitted, however, will show that subsequent to the general increase in 1910, a similar movement was inaugurated in 1912, and increases already gained by this last movement—largely as a result of mediation and arbitration proceedings—have greatly augmented the wage payments of these same carriers.

Increasing Wages.

"The award just recently announced by the arbitrators in the matter of the application for increase in wages by the conductors and trainmen in Eastern territory, it is estimated, will give approximately $6,000,000 increased wages annually to the conductors and trainmen employed by the railroads affected, all of which are in Official Classification territory. The effect of this increase is not shown in any of the other figures which I am using at the present time.

"A full statement, showing the general wage increases made during the three-year period, and the procedure under which they were obtained will be presented.

"The total wage payment of the Baltimore and Ohio System has been increased by an amount in excess of $4,000,000 per annum, comparing the fiscal year 1913 with the fiscal year 1910, due to increased rates of pay and changes in working conditions. Approximately one half of this amount, or $2,000,000, is due to advances gained by the movement begun in 1912, and subsequent to the increases considered by the Commission in the 1910 investigation. This indicates in a general way what has also taken place with each of the other companies. It should be borne in mind that the wages paid on the several roads interested in this proceeding are very nearly on the same basis, and with substantially the same working conditions.

"Since 1910 there has been an increase in the cost of materials, due in part to increased use and higher standards, and in part to increased prices of certain materials entering largely into the cost of operation, such as fuel and track ties. The advance in price of these two items alone in the case of the Baltimore and Ohio System served to increase the expenses of that company in 1913 more than half a million dollars above what they would have been had prices remained as in 1910.

Digitized by Google

INCREASING TAXES.

"The amount paid for taxes by the companies, parties to this proceeding, has shown constant increases during the whole ten-year period, and particularly during the last three years. The increase payment in 1913 over 1903 was $28,720,000 and the increase incident to the last three years was $11,579,000. In the case of the three systems selected by the Commission as typical, the amount of money actually paid as taxes during the year 1913 was $31,216,000, being $7,854,000 more than was paid in 1910.

"Legislation, both state and federal, enacted during the last ten years, has brought steadily increasing burdens upon the carriers. It is not proposed to question the merits of any of the legislation referred to in this connection. For the present purpose, it is sufficient to say that the effect upon cost of operation has been and will be the same, regardless of the merit of the measure. Among the measures which have affected cost of operation, I may mention: Employers' liability and compensation acts, full crew bills, so-called semi-monthly pay laws, safety appliance and standardization of equipment acts, and acts requiring the elimination of grade crossings, etc. The effect of the so-called full crew laws alone has been to increase the expenses of these carriers more than $4,000,000 per annum.

"The public demands to-day a higher standard of service than ever before, and while it may be that the wishes of the public in this particular have not been fully realized, none the less, much has been done in that direction, all of which is reflected in the cost of operation.

"One other very important influence upon the expense of railroad operations, when considered in a broad sense, is the higher rate of interest which the companies have been obliged to pay in recent years for new money raised for improvement purposes. It is believed that in the case of the carriers particularly the cost of new capital has been made higher than it otherwise would have been, by the constantly narrowing margin between income and outgo, as it is upon this margin chiefly that the railroads in this territory must rely as the basis for raising additional capital.

RAILROADS FEEL HIGH COST OF LIVING.

"In short, the railroads have felt the burden of the increased cost of living, like all other enterprises or individuals, but unlike all others have not been permitted so far to raise their prices or adjust their charges in recognition of that burden.

"Further, the rates which were in effect in 1910 have not in the aggregate been maintained—that is to say, while certain increases have been made during the period in mind, decreases have also come about, so that the general basis of rates has been lowered, to some extent by orders of the regulating commissions, and perhaps to an equal if not greater extent by commercial conditions or influences beyond the power of the carriers to resist. The net result of this movement is indicated in the statement that if the same rates and classifications which were in effect in 1910 had remained in effect in 1913, the freight earnings of the Baltimore and Ohio System, in the year last mentioned, would have been over $900,000 greater than they actually were, and the net income would have shown the same increase. It should be understood that this tendency will continue to lower the general level of the rate structure for some time to come, and it should be taken into account when deciding upon any fair basis of rates for the future.

OTHER NATIONS RAISING FREIGHT RATES.

"In addition to the actual reduction in rates, above referred to, the continuous decline in the value, that is to say the purchasing power of money for a number of years past, has had the effect of diminishing still further the burden of the rate to the shipper, while at the same time increasing the burden of the carriers. This influence, reflected in the higher cost of operations, has been worldwide, and has been recognized by rate advances recently made by railroads in England, Italy, Switzerland, Belgium, Denmark, Russia, Austria, Hungary and other countries.

"Having set forth the results of the operation of these carriers, to show that the revenue received upon the existing basis of rates is inadequate, and having pointed out some of the causes which have served to bring about this condition, we come now to a consideration of what general course the carriers may pursue to meet the situation.

"If the situation is as I have shown, it is clear that the remedy must come from such changes, or such line of action as will serve to increase net earnings, and this result might be brought about by one of three methods or by a combination of some or all of them. A large reduction in cost of operation—other conditions remaining as at present—would produce larger net earnings. A large increase in gross earnings, if the additional business could be handled with the present facilities and at present operating ratios, would also result in a larger net, and it is obvious that an increase in freight charges, other conditions remaining as at present, would bring about the same result.

"I do not believe it will be possible to obtain the necessary relief either by reducing wages already in effect, or by making any very considerable reduction in the number of men employed; nor do I believe it will be possible to effect economies in operation of sufficient magnitude to have any saving effect upon the situation. Undoubtedly further economies will be brought about, but it is altogether likely that in the future, as in the past, they will be more than offset by increased taxes, by the effect of further legislation, which is almost certain to come about, and by other unavoidable increases in expenses.

OPERATING ECONOMIES.

"It appears from the tables submitted that coincident with increased property investment during the past three years, practically all of the railroads in this proceeding have largely increased the average tractive power of their locomotives and the carrying capacity of their cars, and have also made substantial increases in their train load, all of which has tended to more economiacl operation. Speaking more specifically, the Baltimore and Ohio Company, having made exceptionally large capital expenditures during the period last mentioned, was enabled to effect such increase in

Digitized by Google

its freight train load as to result in a saving in the fiscal year 1913 when compared with 1910 of over 9,000,00 freight train miles, which, at an estimated cost of fifty cents per train mile, accomplished a saving in transportation costs of approximately $4,500,000 per annum. This large saving, however, was more than offset by increases in other expenses, due to causes which I have already mentioned. I feel confident that the relief which is necessary if these carriers are to meet the standard suggested by the Commission in its report I. C. C. 3400 is not to be found in more efficient operation.

To Raise Rates Only Alternative.

"We next come to the question of large increase in gross earnings. Under certain conditions it might properly be expected that larger gross earnings would give increased net, but it so happens that the railroads involved in this proceeding are located in that part of the United States where commercial and industrial development has been most intense, and it will be shown that in order to increase the gross earnings of these particular companies to any great extent at the existing rates, it would be necessary for them to handle a volume of business much beyond their present carrying capacity. It would, therefore, be necessary to obtain and spend a large amount of new capital for increased facilities before gross earnings could be greatly augmented, and, as has already been shown, new capital invested in such facilities during the last three years has generally failed to earn any return whatever upon the investment. For this reason I do not think we can safely look for relief in the one direction of increased gross earnings, and this brings us to the third remaining method suggested—that is, increased charges, or increased rates and fares.

"Inasmuch as the passenger fares charged by these several companies are generally the result of legislative enactments, and the mail pay and express rates are also beyond the control of the railroads, it will be seen at once that no immediate relief and perhaps no very considerable relief at any time, can be obtained in these directions, and we are consequently forced to consider an advance of freight rates as the one available source of increased earnings. When this same question was before the Commission in case I. C. C. 3400, it was strongly urged by shippers who opposed the increase at that time, that, if it should be shown that the carriers did need increased revenue, and if it should also appear that such increased revenue ought to be obtained by increased freight rates, such advance should not be obtained as was then proposed, by a very considerable advance of some of the rates and no advance of others. It was pointed out that the rate structure, such as it was at that time, was the result of a long period of competition, plus the influence of many years of state and federal regulation, and that commercial and industrial conditions generally had grown up in harmony with the existing structure, and it was urged that the relation of rates between different places and between themselves ought not to be violently or unnecessarily disturbed. The force of this argument has been recognized by the carriers, and in the present instance, while it is proposed to secure the necessary increased revenue by an advance of freight rates, it is also proposed that it should be obtained by an increase generally of five per cent, using minima of five cents per ton and of one quarter of a cent per hundredweight, preserving so far as possible existing competitive adjustments as between localities. This method takes full cognizance of the claim previously made by the shippers that the existing rate structure should not be unnecessarily disturbed so far as relation between rates is concerned.

"The amount of advance, or the percentage of increase now proposed is, in the opinion of those who are parties to this movement, too small to properly meet the exigencies of the case. It was felt, when the matter was first discussed, and that feeling has been strengthened with the passage of time, that a 10 per cent increase of freight rates was necessary and should be requested at the present time, and while all felt that 10 per cent was not higher than the conditions justify, the lesser advance of five per cent was finally determined upon, because it was recognized that the whole rate situation was a matter of delicate relationship, and the individual carriers were naturally solicitous that nothing should be done to disturb the free and well-established movement of traffic. An increase of five per cent, it was thought, would not be large enough to affect seriously, if at all, commercial adjustments, and the increased net which would be gained by such an advance, while not of itself equal to the necessities of the case, would in any event be of assistance, and most important of all, the general increase of rates would serve to direct attention to the relationship which does and must exist between railroad charges and the total cost of operation.

"It was urged in the previous hearing that the carriers at that time were unable to show by actual test that the rates in effect were insufficient, and that they failed to show the necessity for increased revenue. We believe that in the present case, the evidence, showing the need of additional revenue, is ample. It was suggested also that even if additional revenue were necessary at that time, the plan proposed was not the right one by which to obtain it. The carriers accept that point of view, and now propose that the increased revenue be obtained by an advance of a small percentage of all rates in the territory affected. It is believed that the plan now submited is the fairest and best one possible under all the circumstances.

"In conclusion: I have shown that tendencies, which have been operating over a period of at least ten years, have resulted in such diminishing net returns that it has gradually come about that money invested in these railroads, because of the low average rates prevailing in so-called Official Classification territory, and for other reasons, does not earn the same return as money invested in other enterprises of similar kind or character. As a matter of fact, money so invested during the last three years, taken as a whole, has earned no return whatever. In view of all this, those responsible for the management of these properties would not be justified in continuing large expenditures of new capital for additional facilities and equipment, even if such capital were available at reasonable rates of interest.

Digitized by Google

$200,000,000 Capital Invested Each Year.

"I have also shown that the railroads in Official Classification territory have increased their property investment for new tracks, stations, locomotives, freight and passenger cars, and for other similar purposes at the rate of approximately $200,000,000 per annum during the whole of the last ten-year period, and it is certain that the continued annual expenditure of a sum even greater than that will be necessary for similar purposes, if the carrying capacity of the railroads in this territory is to keep pace with the normal growth of commerce.

"The immediate and all-important question is, How shall these railroads obtain the new capital necessary if they are to provide the needed facilities and furnish the high-class service which the public interest demands, and to which the public is properly entitled? The answer, we think, is to be found in the following words which appear in the report of this Commission, from which I have already quoted:

We should allow such rates which will yield to this capital as large a return as it could have obtained from other investment of the same grade. If rates formerly in effect have become insufficient, then higher rates should be permitted. Commerce and industry cannot afford to wait on transportation facilities.

At the conclusion of Mr. Willard's address, Mr. Delano made the following statement on behalf of the lines in the Central Freight Association territory:

Statement of F. A. Delano.

"In the 1910 case the Commission reiterated a principle it had frequently applied in previous cases involving the reasonableness of competitive rates, which is tersely stated in the sentence taken from the Spokane case.

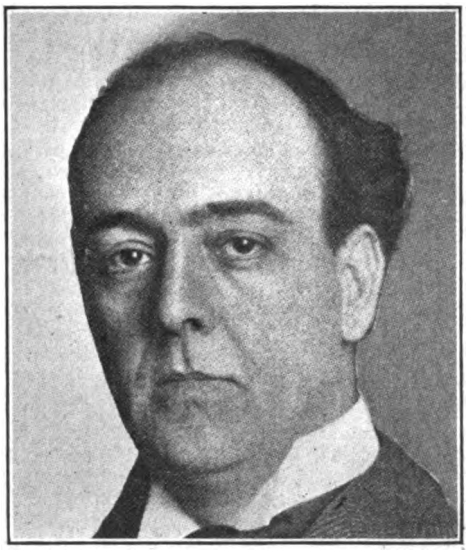
"In applying this principle in the 1910 case, the Commission held that the Pennsylvania, New York Central and Baltimore and Ohio systems were, for the purpose of measuring the reasonableness of rates, fairly typical of the railroads in Official Classification territory.

"Mr. Willard has indicated in his statement that the lines generally will offer evidence which will show that they are now entitled, on the authority of that ruling, to increase their rate.

"That ruling was no doubt justified by the evidence submitted in that case, but we, who represent the Central Freight Association lines, do not believe the evidence in that case fully developed the whole railroad stiuation in the territory.

"We concur in all that Mr. Willard has said and believe the evidence will show that the systems I have mentioned considered alone are entitled to an increase in rates, but we are not satisfied with the ruling of the Commission that those systems are typical of the lines in the territory and believe that if the ruling should be affirmed as a fixed precedent for future guidance, its application will cause irreparable injury, not only to them, but also to the people they serve, and we have accordingly determined to bring to the attention of the Commission in the present case evidence which we believe will justify a reconsideration of the subject; and I have been delegated to briefly outline that evidence.

"We will participate with the trunk lines in offering testimony on the general features of the case and will confine our separate presentation to



Frederic A. Delano.
President, Wabash Railroad.

the submission of additional evidence which, we believe, will show the ruling of the Commission, that the systems I have mentioned are fairly typical of the whole situation in the territory, ought not to become a fixed precedent, and that the whole situation in Central Freight Association territory is the fair measure of the reasonableness of the rates in that territory, and calls for a very substantial increase in rates.

Official Classification Territory.

"Official Classification territory embraces three distinct and independent railroad territories and rate zones, which we will endeavor to show were created in a natural way in the evolution and development of the railroad business by economic conditions peculiar to each, but not common to two of them.

New England Territory.

"First, we have the New England territory, which embraces the New England States, and contains an area of approximately 64,000 square miles, inhabited by approximately eleven million people, or 174 inhabitants to the square mile, and traversed by 8,071 miles of railway lines, which touch an average population, including New York City, of 1,389 per mile of railroad. The population of that territory is dense, and, in the main, assembled in large industrial centers, the rural population of the New England States being only 17 per cent of the whole population.

That territory does not produce fuel or other raw material, except granite, marble and lumber—and those do not comprise a substantial tonnage—and, while the traffic is dense, it consists largely of merchandise, manufactures and miscellaneous. For instance, approximately 45 per cent of the tonnage of the two principal railroads in that territory, during the year 1912, consisted of that class of traffic.

"The hauls in that territory are short. Little

Digitized by Google

traffic passes through, except imports and exports, and the bulk of the traffic originating or destined beyond that territory is received from or delivered at its west boundary to lines running west and south, while the water-borne tonnage is largely hauled but short distances to inland towns.

"These conditions, and the isolated location of that territory along the Atlantic seaboard, water competition and numerous other economic influences peculiar to it, which the evidence will bring out more in detail, have created a railroad territory and fabric of rates and traffic conditions peculiar to it and independent of the West and South.

Trunk Line Territory.

"We have next the Trunk Line territory, which embraces the area west of the Hudson River and Atlantic seaboard, north of the Potomac River and east of what is known as the 'Western Termini'—a line extending from Buffalo through Pittsburgh to the Ohio River. This territory embraces an area of 112,000 square miles, and has a population of twenty-one million, or 207 inhabitants to the square mile, and is traversed by 23,777 miles of railway lines, which touch an average population of 889 per mile of railroad.

"As in the New England territory, the population in the Trunk Line territory is found largely in its great cities—the rural population of the states included in the territory being only 30 per cent of the whole.

"The area and population of this territory are greater than the area and population of the New England territory, but the area per mile of railroad is only about one half, which indicates that the former is more amply supplied with railroad transportation facilities than the latter. While the population per mile of railroad is greater in New England territory than in Trunk Line territory, the tonnage in the latter, per mile of railroad, is approximately twice the tonnage in the former. The character of the traffic is likewise substantially different in the two territories. For instance, the combined tonnage of products of mines carried by the Pennsylvania Railroad proper, the New York Central proper, and the Baltimore and Ohio System in 1912 was approximately ten times the same class of tonnage carried by the two principal railroads of New England. That class of tonnage comprised 66 per cent of the total tonnage of the Pennsylvania and the Baltimore and Ohio, but only 30 per cent of the total tonnage of the two New England roads.

"The evidence will show that Trunk Line territory comprises relatively the largest population per square mile, the greatest industrial activity and the densest traffic of any similar area in the country. It embraces the great manufacturing centers of New York, New Jersey and Pennsylvania, and the Pittsburgh district—the greatest tonnage center in the world.

"In the early history of railroad building in that territory, the railroads were built westward from New York and other Atlantic seaboard cities on the south, and either teminated at Buffalo, on the lakes, or at Ohio River cities. The rates were made applicable to these lines as originally constructed, and the character of the traffic, physical surroundings and other economic influences, which we will point out more in detail in the evidence, built up and have preserved to this day a railroad territory and a fabric of rates and traffic conditions peculiar to it and independent of and distinct from the territory east, west and south of it.

Central Freight Association Territory.

"The remainder of Official Classification territory—the vast area extending from Trunk Line territory to the Mississippi River and the lakes—comprises what is known as Central Freight Association territory.

"The portion of that territory in the United States contains an area of approximately 186,000 square miles, inhabited by about nineteen millions of people, or 122 inhabitants to the square mile, as compared with 207 in Trunk Line territory and 174 in New England territory, and is traversed by 35,849 miles of railroad, which touch an average population of 506 per mile of railroad, as compared with 889 in Trunk Line territory and 1,389 in New England territory.

"It will be noted that, while this territory contains two million less population than Trunk Line territory, its area is 74,000 square miles greater, and is traversed by 12,072 more miles of railroad, and while it contains about eight million more inhabitants than New England territory, it comprises more than three times the area and is traversed by 27,778 more miles of railroad.

"The population of the principal states in Central Freight Association territory is about equally divided between the cities and the rural sections, the percentage of rural population being 46 per cent of the whole. But it does not follow that it has too many railroads or too much mileage, because as we have seen the population is thinly spread over 186,000 square miles, as compared with a two-million greater population in Trunk Line territory assembled on 112,000 square miles, and only eight millions less population in New England territory assembled on 64,000 square miles.

"The traffic in this territory is diversified and very general in character, and is substantially different in many respects from the traffic in the other territories.

Special Nature of Middle West Railroads.

"This territory was created largely by physical conditions and natural development and growth of population. Its numerous lakes and rivers, some of which form its boundaries, attracted to their borders the early settlements and cities, and in time came Chicago and St. Louis, its two chief centers of population. The territory is comparatively level, which facilitated railroad building, and as population increased, railroads were constructed in all directions, the objective points being, naturally, lake and river cities.

"It is a well-known fact that in the development of that territory water competition has always been an important factor, and that the railroads have promoted the growth of population and industrial development by low rates. Again, railroad building at times has been in excess of the growth of the country, and caused abnormal competition, resulting in lower rates.

"At the time the Government entered upon the regulation of rates, those prevailing in Central Freight Association territory, as a body, were comparatively the lowest rates prevailing in any

Digitized by Google

section of the country, and in recent years they have been still further reduced—and especially passenger fares, which have been reduced from three to two cents per mile, or 33 1-3 per cent—in all the states in that territory.

"The influences I have mentioned, which we will show in detail in the evidence, have resulted in the bankruptcy of a substantial portion of the railroad mileage in the territory and in depleting the earnings and debilitating the credit of the remaining lines to an extent which, unless relieved by prompt and substantial advances of rates, will naturally result in impeding the commerce and transportation of that section of the country.

"On the evidence, we will urge that, owing to the different conditions existing in these three component parts of Official Classification territory, lines traversing two of these sections ought not to be regarded as typical of the whole situation in the territory or in the component parts. Undoubtedly a great many important considerations are common to all the lines in the three component parts, and accordingly the showing of the Pennsylvania, Baltimore and Ohio and New York Central Systems will be of great value to the Commission. We do not mean to disparage, or in any way discredit, the showing of those systems, but merely contend that their showing is not conclusive or typical of the entire situation.

Grouping of Lines in C. F. A. Territory.

"We believe it will be pertinent to show the conditions prevailing in Central Freight Association territory, and will, therefore, offer in evidence, among other things, statements of the mileage, earnings and results of operation of the lines located therein, with a view of indicating the 'whole situation' in that territory.

"There are, in the territory, 35,849 miles of railroad (exclusive of the mileage of switching and terminal companies) owned by 93 companies.

"We have omitted switching and terminal companies because they perform a special service on an arbitrary basis, generally fixed on a per-car rate.

"The mileage, however, includes the mileage in C. F. A territory of the Mobile and Ohio; St. Louis, Iron Mountain and Southern; Louisville and Nashville; Southern Railway; St. Louis Southwestern; Chicago, Burlington and Quincy, and Norfolk and Western—1,892 miles, or 5.3 per cent of the total—but we exclude that mileage from our figures, because it is only 7 per cent of the mileage of those companies, and the results of their operation cannot be segregated. As 93 per cent of the mileage of these companies is in higher rate zones, it is obvious that the operations of these companies as a whole would be immaterial.

"This leaves 33,957 miles of railroad, or 94.7 per cent of the total, in the territory.

"In presenting our figures we will be obliged to add to that mileage the results of the operation of 264 miles of the Chicago and Alton, 2,628 miles of the Illinois Central, and 859 miles of the Wabash. The principal operation of these three companies is in the territory, the 3,751 miles outside being west of the Mississippi River or south of the Ohio River, in higher rate zones, and we include them because the results of operation of the mileage in the territory cannot be segregated.

"We will also include 3,401 miles of the Baltimore and Ohio and Erie, which are located in Trunk Line territory, because the operation of this mileage cannot be segregated from their lines in the territory.

Special Groupings of C. F. A. Railroads.

"Our figures will, therefore, embrace the results of operation of 41,109 miles of railroad, and we will arrange them in four groups:

"*Group One*—embraces the 41,109 miles of railroad I have mentioned, except 6,443 miles of Erie Lines east of Marion, Ohio, and the Baltimore and Ohio System, and 2,729 miles—the aggregate mileage of 46 short railroads in the territory which, together, earned less than eight million dollars in 1910.

"*Group Two*—embraces the Erie Lines east of Marion, Ohio, and Baltimore and Ohio System, aggregating 6,443 miles, 3,401 of which are located in Trunk Line territory. This mileage is grouped together because the results of operation of the mileage in C. F. A. territory cannot be segregated.

"*Group Three*—embraces 28 of the 38 roads in Group One, with an aggregate mileage of 23,167 miles, which includes 19,416 miles, or 51½ per cent of the entire mileage in the territory, and embraces such important lines as the Big Four System; the Vandalia; the Chicago and Eastern Illinois; Nickel Plate; Grand Trunk Western; Grand Rapids and Indiana; Pere Marquette; Cincinnati, Hamilton and Dayton; Illinois Central; Chicago and Alton, and Wabash.

"*Group Four*—embraces 46 companies with an aggregate mileage of 2,729 miles, or 7½ per cent of the total mileage in the territory, which, together, in 1910 earned less than eight million dollars. These roads are important factors in the development and commerce of the respective communities they serve, but, as a rule, they are in great financial distress, and, being short lines, we thought it natural to group them together.

Lines Representing the Whole Situation.

"We believe that Group Three embraces lines which are fairly representative of the whole railroad situation in the territory, and for that reason we will refer to it in some detail.

"We have omitted from this group the main line connections of the Trunk Line Systems—the Lake Shore, the Michigan Central, the Pennsylvania Company and the Panhandle—although the figures will show that their prosperity has been substantially impaired during the last few years by a constantly increasing ratio of expense to earnings.

"The fact, however, that this mileage as a whole was constructed at a very low capital charge and forms integral parts of the best and strongest railway systems of the country, to say nothing of the credit and business they have enjoyed from their affiliations and the returns on their outside investments, place them in a class by themselves. These facts (which will be shown more in detail in the evidence) will conclusively prove that, while those lines, no doubt, need an increase in rates, they do not belong in the group of railroads which fairly represents the railroads in the territory.

Digitized by Google

"We have also excluded from Group Three the Pittsburgh and Lake Erie, Bessemer and Lake Erie, Hocking Valley, Kanawha and Michigan, Toledo and Ohio Central and Wheeling and Lake Erie. These roads are located in a comparatively small area between the Great Lakes and the iron furnaces and coal mines of Ohio and their traffic is not of a general nature, but substantially confined to the products of mines; their tonnage of these products during 1912 being 78.6 per cent of their entire tonnage, but the exceptional feature of their situation lies not only in the volume of this mineral traffic, but in the fact that by reason of hauling iron ore in one direction and coal in the reverse way, they have a balanced traffic, which produces an unusually favorable operating condition.

"While these lines are within the boundaries of the territory, they do not enter into the general railroad situation and cannot be included in a group of roads fairly representative of all the railroads in the territory.

"We have also excluded from Group Three the 46 short lines whose aggregate earnings for 1910 were less than eight million dollars, because, as we have said, those lines are short, their earnings are small, and they are, as a rule, in financial distress and ought not to be included in a group of roads representative of the railroads in the territory.

"We have included in Group Three 28 companies, with an aggregate mileage of 23,167 miles, which traverse all parts of the territory and participate in the general traffic of that section of the country.

"We believe a mere glance at the map of this large mileage (23,167 miles) will indicate that it is fairly representative of the territory. In any event, we may be assured that if this mileage is not influential in determining the reasonableness of rates, the prosperity, commerce and development of the whole territory will be placed in jeopardy.

Salient Facts from the Evidence.

"On the evidence we will present, in detail, our contentions, but my present purpose will be served by merely calling your attention to a few salient facts.

"This great network of railroads covering the entire territory, during the year ending June 30, 1910, earned 239 million dollars, and during the year ending June 30, 1913, 275 million dollars, or a gross increase of about 36 million dollars; but in the former year the operating expenses and taxes were 182 million dollars, and in the latter year 227 million dollars, or an increase in expenses of about 45 million dollars, resulting in a decrease in net revenues, after payment of taxes of over nine million dollars, and in net corporate revenue of more than 16 million dollars.

"As stated in other words, the ratio of operating expenses and taxes to earnings, during the same period, increased from 76.3 per cent to 82.8 per cent.

"These same roads, during the year ending June 30, 1908, (which will be remembered as a panic year), earned 212 million dollars, and during the year ending June 30, 1913, 275 million, or an increase of 63 million; but, during the year ending June 30, 1908, the operating expenses and taxes were 165 million, and the year ending June 30, 1913, 227 million—an increase of about 62 million

Net Corporate Income Decreasing.

"Now, despite the fact that during that same period more than 175 million dollars were put into additions and betterments, the net, after deducting operating expenses and taxes, showed an increase of only $800,000, while the net corporate income actually decreased about eight million dollars.

"As we have shown, this mileage comprises 51½ per cent of the entire mileage in the territory, and if we add the mileage of the 46 short railroads, we will have 59.1 per cent of the entire mileage of the territory, all of which is in deplorable financial condition.

"While, as we have said, the evidence will show the lines embraced in Group Three are fairly representative of the whole situation in the territory, the lines embraced in Group One show a result almost equally deplorable, especially in the last few years.

"Group One, as we have seen, embraces 78.6 per cent of the entire mileage in the territory, including all the strong lines, and besides, 3,751 miles outside of the territory in higher rate zones; and excludes only the 46 short lines which are in financial straits, and the Erie east of Marion, Ohio, and the Baltimore and Ohio System, and the short projections of southern lines into the territory.

"Group One, in the fiscal year 1910, earned $457,000,000, and in the fiscal year 1913, $533,000,000, or showed an increase of $76,000,000, but operating expenses and taxes during the former year were $329,000,000, and during the latter year, $417,000,000, or an increase in expenses and taxes of $88,000,000, resulting in a decrease in net revenue, after deducting operating expenses and taxes, of $12,000,000, and a decrease in net corporate income of $17,500,000.

"These large decreases resulted in the face of the investment of vast sums of new money for additions and betterments—in other words, notwithstanding the investment of this new capital, the ratio of operating expenses to gross revenue increased from 72 per cent in 1910 to 78.2 per cent in 1913.

Latest Figures Less Encouraging.

"The figures for the first two months of the present fiscal year are still less encouraging; for instance, the net revenue, after deducting operating expenses and taxes of the lines in Group One for the two months mentioned, decreased about $4,500,000, as compared with the same two months last year, while the decrease of the lines in Group Three was about $2,000,000 as compared with the same months last year.

"The evidence will show that the lines in Central Freight Association territory are confronted with the expenditure in the near future of millions of dollars in the separation of grades in various cities, on which they will receive no adequate return, and many of the lines have not the credit to raise this money. This circumstance, in view of the present conditions of the roads, presents a serious situation which calls for prompt relief.

"It will be obvious from the evidence that a five per cent increase in rates will not be adequate to

Digitized by Google

meet the demands of the territory. As I have said, the rates in that territory, both freight and passenger, are the lowest rates prevailing in the United States, and the interests of the people of that rapidly growing and developing section of the country, to say nothing of the carriers, require, in the near future, a readjustment of the rates, both freight and passenger, to a basis which will enable that territory to have good railroads and the people to have efficient and adequate service, and to progress measurably with the other sections of the country."

Annual Meeting and Banquet of Railway Business Association

THE annual banquet of the Railway Business Association held in New York at the Waldorf-Astoria Hotel on the evening of December 11, 1913, proved to be the most notable and significant in the history of that organization. The diners were addressed by Howard Elliott, chairman of the New Haven System, and by Governor Cox, of Ohio, and the remarkable demonstrations which greeted the references made to the necessity for a liberal railway policy, left no doubts in the minds of those present of the favorable attitude of big business towards a readjustment in transportation charges by which the carriers will be permitted to sufficiently increase their incomes to properly meet the increasing demands made upon them. George A. Post, the able president of the Association, acted as toastmaster, and it is hardly necessary to state that he filled this exacting position to the complete satisfaction of all present.

Chairman Elliott's address was closely followed and frequently punctured with applause. He spoke in part as follows:

ADDRESS BY HOWARD ELLIOTT.

"National need of terminal and other railway facilities having been thoroughly impressed upon the public mind, shippers and editors generally convinced that larger net railway returns should be permitted, what are the reasons and perplexities which prevent the people from giving effect to a policy that will cure the trouble, making it unanimous? Even if there is only a vigorous minority opposed to such policy candid consideration of their objections is due them.

"It is claimed that the management of some roads has not been honest—that insiders have profited when they should not. The morals of all kinds of business have improved year by year and things have been done in railroad and other business in the development of the country that were probably not right then—and that certainly are frowned upon now by law and public opinion. Such things ought never to have been done. Owners of railways should root out dishonesty if it exists, and if they will not, public authority will do it. But is there anything in the situation that warrants calling a halt on the development of a continent? Every time a clergyman, a doctor, a senator, or a cashier is punished, are we forthwith to abolish all clergymen, all doctors, all senators, and all cashiers, while we unfrock that particular clergyman, convict that particular doctor of malpractice, expel that particular senator, or jail that particular cashier?

"It is said that some railways are over-capitalized. Whether they are or not, and certainly American roads have led the world in refraining from it, no more capitalization ought to be created than is necessary in order to serve the public. If too much was issued by some roads in the past, this is to be regretted, but no workable method has been suggested by which securities issued legally and bought in good faith can be taken from their owners without failures and receiverships that harm many more people than the owners of the securities. As for the future, every railway of importance runs through one or more states which regulate security issues. And apart from that those responsible for railway management realize, as they never did before, the absolute necessity of sound business principles in issuing securities, law or no law. The present problem is not to restrict the issues of securities but to find people willing to buy them.

"One hears that if securities were sold over the counter the bankers' commission would be saved. Perhaps some day, if confidence can be restored, part of such commissions might be saved, but a railroad must have financial experts, as well as engineering experts, and pay a fair price for services rendered. If the commissions can be saved they ought to be. But not even city, state and federal governments, whose credit is based on the taxing power, have been able at all times to float even moderately large popular loans without the aid of bankers, so it would seem as if it was to the interest of the people to be patient with a railway which has practically no control over the price of labor needed to produce that transportation.

"Others object because they say the new revenue would go to increase dividends. So some of it would and must. The dividend which a stockholder receives is not all that he would like or that his managers want to pay, but is an amount needed to induce him and others to buy more stock or bonds when an enlarged plant is necessary in order to meet the desires and absolute necessities of the public.

"It is said that the increased income needed could be had by economies. It is true that economies have been introduced, and there is room for more of them. Railroad managers as a whole are pushing hard every day to improve men, methods and facilities. Many economies, however, can only be adopted by throwing away old appliances and buying new ones, which is the case in mills and factories as well as in railroads. And if the railroads have no money with which to get the new tools they must do the best they can with the old ones. No effort in this direction should be neglected, and no other industry is, or in the nature of things can be, so thoroughly organized nation-wide as the railways to co-operate in studying, experimenting and standardizing progress. But in view of the wonderful savings already ac-

Digitized by Google

complished, both major and minor, in the past few years, and the larger percentages of gross earnings absorbed by expenses and taxes, it is doubtful if the people should depend on such measures to offset the apparently irresistible rise in wages and in the price of materials, the higher cost of capital, and the demands for more elaborate facilities and luxurious service.

"Are any of these obstacles sufficiently important to delay such revision of rate schedules as will meet this anomalous situation of increasing gross earnings, but declining net earnings, and still more rapidly declining net corporate income after payment of fixed charges?

"The railway managers of the country want to know where to improve. They welcome just criticism based on real knowledge of all the facts. It is their purpose to profit by it. To serve the public adequately, on the other hand, is also their purpose, and it is their duty to seek diligently from the appropriate authorities the authority and help necessary, if the railway is to do what the people want and must have if the country is to grow.

"For the New England lines that I represent, I ask the patient good-will of her people and of the nation while this peculiar and difficult problem is being solved, and I ask that all believe in our intention and desire to conform in good faith to the laws, state and national, when it is clear just what the laws are, and that there is no conflict between State and Nation, and in our aim to serve the public interest to the extent of our ability—moral, mental, physical and financial. The tendency of rate regulation is toward a mileage basis, which must be modified to meet conditions such as exist in the United States—where many commodities must be moved long distances. This entails readjustment for many communities built up on well established rate relations. New England, owing to her geographical situation, would be crippled by the sudden and absolute application of a mileage basis.

"These six states have one fourteenth of the national population, but they have one twelfth of the national wealth. They consume one eighth of the materials of manufacture, and they have one sixth of the bank deposits. New England appeals confidently to business men in other parts of the country to seek growth through the advantages they have rather than by attempting to force a readjustment which will involve serious consequences to New England and to the whole country, which benefits by New England's thrifty accumulation of capital, by her contributions to progress, and by her very large purchases of the products of other regions.

Address of Governor Cox.

Governor Cox's address, while defending government regulation and criticising some of the past tendencies of railway management, was, nevertheless, a strong plea for a liberal railway policy and practically an endorsement of the railroads' contention that the income derived from present rates is not sufficient to properly meet the constantly increasing demands of commerce. He spoke in part as follows:

"Something must be done with the railroad question. If you lay your finger on the pulse of the railroad organism you have unmistakable symptoms of the country's prosperity or adversity. When Ohio was stricken last spring with the great flood catastrophe we lay stunned and helpless until railroad commiunication was established. None will deny how important it is to conserve this utility, and by this is meant protection from unwise legislation and a guarantee of measurable safety to the individuals and institutions that have hazarded their capital.

"Now, what is the condition of the railroads? Tonnage continues stupendous. Terminals in every city are insufficient. There is congestion. Service is beginning to show the lack of old time regularity. Rolling stock is inadequate. The development of the country makes a call on the railroads for extensions and equipment which finds an enforced feeble response. They could advantageously to the public use hundreds of millions of dollars right now.

"The railroads cannot borrow the money to provide for the situation. Short time notes have been given to meet current and emergency expenses, and if the banks were to demand payment we would be in the throes of a well organized panic. Investors have been driven to other fields, notwithstanding no business is based on a more stable utility than that of the railroads. The amount of securities listed on the New York Stock Exchange by steam railroads in 1912 was the smallest in ten years.

"You hear in many quarters the statement that adverse legislation and the policy of regulation are the largest contributing factors. I do not subscribe to this view. Sane regulation will become the ultimate salvation of the business. One cannot resist the thought, when he surveys the abuses of overcapitalization, finanical adventure and personal exploitation, that the mistake in regulation has been that it did not come soon enough. No one will seek to condone the practice of milking railroads in order that executive officers and directors might be illegally and immorally given vast fortunes through the artful and insidious method of contracting with themselves for construction work. No man in conscience will avow the propriety of a wild cat policy in the issuance of securities. No community in America will produce the man who will attempt to justify the practices which have shaken the confidence of the conservative thought of New England.

"We might just as well recognize, however, that a puritanical severity is not going to do any good. The thing to do is to restore the patient and then prescribe and enforce a diet and behavior which will prevent recurrent illness. Each age brings its changes in accepted fundamentals of justice. Our fathers subscribed to many things in full conscience that are shocking to present day ideals. We must therefore be consistent and recognize this as fundamentally just—that the transgression of yesterday cannot and must not be measured with the ethical yardstick of to-day. It is more creditable to adhere to this doctrine than to frame a policy of confiscating the holdings of present owners who are in no way to blame for the abuse of those who sold them.

"You cannot buy land for terminals; lay tracks of steel to accommodate the growing traffic of the nation; build spurs to mines, cities or agricultural centers, without an increased cost in investment. You can't sell the securities unless the public is assured of a return on the investment. Every phase of the fiscal situation of the railroads suggests that something be done not only to es-

Digitized by Google

tablish in the minds of the investing public some fixed idea of the inherent value of the railroads, but to frame a national policy, securely supported by an intelligent public opinion, for the conservation of the transportation utility. I introduce the suggestion that ultimate relief will never come until the Interstate Commerce Commission passes upon the issuance of securities. I spent a few days in Washington last week and heard everywhere the statement that the railroads would be given at once, without a word, the desired raise in rate if the Government were assured that the increased revenue would be properly applied. Ask the Government to step in as a representative alike of the public, the railroads and the investor, issue securities of smaller denominations and in ten years the great transportation lines will in fact belong to the people, and you will have public ownership rather than Government ownership.

"Government, from the standpoint of morals and expediency, must permit the roads living rates. If it develops that while the gross receipts have increased, the net receipts are considerably diminished by the liberal policy of society, then relief ought to be granted, whether it be one per cent, five per cent, or ten per cent, that is needed. There is nothing more harmful than the tendency to hold a fetish. There is no more offensive species of standpatism than to impose a rate one year and continue it without term.

"Let us all dedicate ourselves to the solution of this great problem of transportation—recognizing that it concerns every community and every household. In the forum of public opinion every issue has been settled and ultimately settled right in this our glorious country. If progress means anything it is that prejudice cannot last and that fair dealing will endure."

Annual Meeting.

The annual meeting, which preceded the banquet, developed an optimism as to the future of American railways, notwithstanding the present serious situation and the many grave problems yet to be solved.

"Current expenses," says the annual report of the General Executive Committee, "tends to dispel the most serious ground for doubt of success for public regulation of privately owned railways. The fear has been that no tribunal of political origin would survive if it permitted an important general increase in transportation charges, because, it was predicted, the shipping public would always resist and when defeated would retaliate by attacks upon the Commission. Instead of this we actually see organized shippers sending resolutions to the Commission declaring not only that they will cheerfully accept an advance if found necessary, but that they will not be represented in opposition at the hearings."

The report continues:

"The public does not and should not relinquish its purpose of scrutinizing the practices of railway corporations and dealing with these where necessary. But it has been made manifest that when national prosperity requires a strengthening of railway revenue public opinion will discountenance attempts to postpone action on the pretext that one or another specific theory of conduct must first be established and enforced. Railway managers are endeavoring as energetically as business men or men in public life to improve standards both of efficiency and of propriety.

"A number of members of the Interstate Commerce Commission and of the state commissions after long service but still in vigorous health have recently retired. Not even an enlightened public opinion will insure the success of regulation unless men who have acquired experience and knowledge are retained. Security of tenure minimizes the waste of time and danger of mistakes involved in breaking in new commissioners. It gives the older commissioners an independence and serenity which promote efficiency and quality of work and it enables the appointing power to command the services of men who would not accept if they believed the position would be used as a political reward.

"Per mile of line 'operating income' in 1913 was only 4.8 per cent above that in 1910, and in July, August and September of the new fiscal year, only 4 per cent above 1910. Fixed charges are still to be deducted. These in 1912 reached 46.8 per cent of 'operating income.' The wage award of six millions a year to the conductors and trainmen will further depress net earnings of the Eastern roads. Those lines in 1911, 1912 and 1913 spent more than 650 million of new capital for improvements and yet in 1913 with gross earnings 186 millions larger than in 1910 their operating income was over 16 millions less. There can be little doubt that at the present time the railways of the country with an investment in plant greatly exceeding that in 1910 are realizing actually less money for improvements, dividends and surplus than they were when the rate advance was denied them.

"What were the railways obliged to leave undone in order to produce even the income they have? In the calendar year 1907 they built 284,188 freight cars; in 1912, only 152,429. The passenger car record was 5,457 in 1907; production in 1912, only 3,060. In 1907 the locomotives built reached 7,362; in 1912 only 4,915. Volume of orders for rolling stock in 1913 has been less than in 1912. Main track built in 1907 was 5,212 miles; in 1912, but 2,997. Yard track (fiscal years) built in 1907 was 3,988 miles; in 1911 (latest figures), 3,392 miles. Terminal facilities, therefore, of which yard track is an important part, have not developed in proportion to the demands which competent authorities have predicted.

"Numerous bills are before Congress which if passed would require enormous expenditures by the railways, notably the steel car bills. Of passenger train cars placed in service in 1909, 51.4 per cent were wooden. The railways without any law have adopted steel. They ordered in 1913 no wooden passenger cars whatever. Congress has no occasion for severity or haste. Some of the bills fix brief periods within which all wooden passenger train cars must be displaced by steel. This should be looked into. It would take ten years with existing car building facilities to substitute steel for wooden, and private capital can not be compelled by law to invest in enlargement of the car building plant. Such substitution would cost more than 600 million dollars and would divert great sums from other purposes more important to safety than steel cars. Many of the wooden passenger train cars which would be scrapped are comparatively new and are reasonably safe for the usual conditions of traffic. The type of steel car is a subject of difference among experts. After an accident a steel car is a means of safety.

Digitized by Google

Precautions to prevent accidents—sound rails, sound ties, good ballast, ample signalling, discipline most important of all—must also be provided. The steel car question will settle down gradually to its proper proportions. We urge Congress to act if at all by avoiding minute specifications and authorizing the Interstate Commerce Commission to deal with the matter in its discretion as experience and study dictate.

"Increased expenditures were compelled in 1913 by full crew laws passed in Arkansas, California, Missouri, Nevada, New Jersey, New York and Ohio; by safety appliance laws passed in California, Colorado, Florida, Kansas, Michigan, Missouri, Nevada, Ohio and Texas; by hours of labor laws passed in California, Missouri, Nevada, New York and Ohio and by grade crossing laws passed in Arkansas, Minnesota, Missouri and New Jersey. The forty state legislatures in session in 1913 enacted 343 laws specifically affecting steam railways as against 276 passed by forty legislatures in 1911. The addition to operating expenses will aggregate very large sums. Only one state, New Hampshire, adopted a law permitting the railways an advance in freight rates prohibited under the previous statute.

"No systematic method has yet been put in effect for co-ordinating Congress, the legislature or the wage arbitration board which compels expenditures with the Commission which regulates rates. We urge the need of mechanism for holding down the obligatory outlays to fit the railway pocketbook.

"Our Association participated in the successful effort to have Congress amend in 1913 the federal railway labor arbitration law. The changes made tend to assure the acceptance of arbitration by both sides and are fairer to both sides in that two neutral arbitrators instead of one must be convinced. Many believe that the danger of strikes should be guarded against by the further step of prohibiting, as in Canada, a strike pending an official investigation and publication of findings. The policy of urging this provision upon Congress and the state legislatures should be carefully considered."

At the morning session, E. B. Leigh, delivered an address under the title of: "Railway Purchases Measure General Business Prosperity." This address led the Association to adopt the following resolution:

"We believe that if the Interstate Commerce Commission finds as a result of its inquiry that the railways need more revenue to enable them to provide service adequate to the growing needs of the public and will grant an increase in transportation rates, the effect will be to promote an immediate improvement in all lines of business."

Other resolutions adopted commend the cooperative spirit of shippers, the press and the Interstate Commerce Commission in considering the rate advance; favor the establishment by Congress of facilities for legislative reference and bill drafting; urge the retention in office of Interstate Commerce Commissioners and state railroad commissioners who by length of service have acquired knowledge and experience and are otherwise fit for the duties of such positions; voting Yes on referendum of the Chamber of Commerce of the United States which if adopted would approve in general while recommending some improvements in the plan submitted by the Secretary of Commerce to the President for the development of foreign and domestic commerce; and declaring with regard to compulsory steel car legislation that "since the most desirable type of steel car is still seriously debated by engineers, since there is a possibility of strengthening wooden cars with steel, and since many wooden cars good for much longer service are reasonably safe for many trains, thorough investigation by men trained in such matters should be the basis of whatever regulation the government undertakes," and "if Congress is to deal with the subject, that body should avoid doing so in detail by statute, and should delegate instead authority to the Interstate Commerce Commission to formulate regulations."

Officers were re-elected as follows:

President, George A. Post, New York.

Treasurer, Charles A. Moore, New York.

Assistant Treasurer, M. S. Clayton, New York.

Vice-Presidents: A. M. Kittridge, Dayton, O.; W. E. Clow, Chicago; G. W. Simmons, St. Louis; S. P. Bush, Columbus, O.; Alba B. Johnson, Philadelphia; H. G. Prout, Pittsburgh, Pa.; W. G. Pearce, New York.

Eight appointive members of the General Executive Committee whose terms expire this year will be named later.

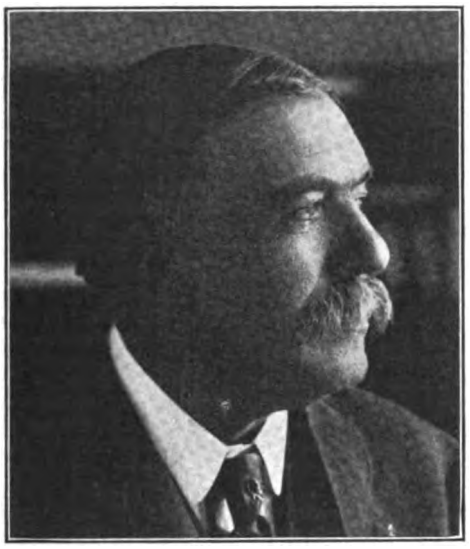
President Ripley's Second Reply to Clifford Thorne

ATTENTION was called in the November issue of the RAILWAY WORLD to a statement made by Clifford Thorne, chairman of the Railroad Commission of Iowa, before the recent convention of the National Association of Railroad Commissioners to the effect that under government ownership, a saving of $464,000,000 could be made in the annual return paid to railway capital.

The attention of President E. P. Ripley, of the Atchison, Topeka and Santa Fe Railway, was called to Mr. Thorne's statement and in a letter to that worthy gentleman he pointed out, among other things, that Mr. Thorne had used misleading figures regarding the interest and dividends now paid annually to railways which had resulted in an error of $211,000,000 a year. Continuing, Mr. Ripley said:

"You stated that the (net) capitalization of the railways on June 30, 1912, was $15,286,101,947; and you calculated, on the basis of the market prices of railway securities in October, 1913, that the railways could be acquired by the government for $13,069,173,383. Even assuming that the conclusion drawn by you from the current market prices was correct—and I do not believe this to be the case—you chose as the basis of your calculations the quotations in a month when railway securities reached one of the lowest levels to which they have fallen in years. It would be just as fair to make a similar calculation based on the quotations in some month when the prices of railway securities were at their maximum, which, of course, would yield a very different result. United States Senator Albert E. Cummins, of your own state, a few years ago estimated that a valuation of all

Digitized by Google



E. P. RIPLEY.
President of the Atchison System.

the railways of the country would amount to $20,000,000,000; and his figure probably is a much better index of what it would cost the government to acquire the railways than is yours. You estimate that if the government acquired the railways it would have to pay only 3 per cent interest on the bonds issued by it. If you have studied the present prices of bonds of the United States Government and of the securities issued by the governments of other countries you are aware that no government could to-day issue a large amount of 3 per cent bonds at par, and that any government that could issue them at less than 4 per cent would be fortunate. If the United States Government should buy the railways at a cost of $20,000,000,000 and should have to pay 3½ per cent interest on the money its total interest would amount to $700,000,000 a year, which exceeds the total interest and dividends now paid by the railways.

"In conclusion, I call your attention to the fact that you make no allowance for the great increase in railway operating expenses that almost certainly would result under government ownership, thereby more than wiping out any conceivable saving that could be made in the cost of capital. The last large railway acquired by the government of a democratic country is the Western Railway of France; and in the four years 1908 to 1912, inclusive, its gross receipts increased only 12 per cent, while its operating expenses increased over 50 per cent, in consequence of which its net earnings declined almost 70 per cent. I leave you to calculate what would be the consequence to the American people if government ownership should be adopted in this country, and government management should produce such results as it has produced in France."

Mr. Thorne answered Mr. Ripley's reply in a letter, in which he admitted the erroneous use of figures regarding interest and dividends, but sought by a different method of calculating to show that the saving which he had estimated could be made was not excessive. This drew from Mr. Ripley, under date of November 15, another letter, the text of which shows the basis on which Mr. Thorne made his second calculation regarding the possible savings, and also replies to Mr. Thorne's argument. Mr. Ripley's second letter to Mr. Thorne is as follows:

"I have your letter of November 11, replying to mine of recent date in which I criticized your attempts to show that under government ownership of railways in this country over $464,000,000 of the return now paid annually to railway capital could be saved. Before replying to some of the statements made in your letter permit me to make clear my own position regarding the question of government ownership in the United States.

"I do not oppose this policy as a railway officer. The government could not acquire the railways without paying just compensation for them. The roads are now being so regulated that the security owners are not receiving an adequate return, and if they could get their money out they could invest it where it would earn a larger return. Therefore, government ownership might be a blessing to the owners of railway securities. While I do not oppose government ownership as a railway officer, I do oppose it as a citizen, because I believe that under our form of government and political conditions it would be the greatest calamity that could possibly befall the American people. You say in your letter, 'Within the next five or ten years you will see government ownership will be one of the great political issues of the day in the United States, and when that issue arises in all its vast importance the real problem will be whether the operation of the railroads can be divorced from politics.' But, upon what conceivable ground can anyone assume that politics would be kept out of the management of state railways in the country? It is not now kept out of the management of the state railways of any country, with the possible exceptions of Prussia and Japan. Furthermore, politics is not now kept out of anything done by our own governments. Since we cannot keep politics out of our river and harbor improvements, or out of our appropriations

CLIFFORD THORNE.
Chairman of the Railroad Commission of Iowa.

Digitized by Google

for public buildings, or even out of our legislation regarding the location and maintenance of army posts and naval stations, how can it be rationally assumed that we could keep it out of a state railway system employing 1,700,000 citizens and voters? And if we did not keep politics out operating expenses would increase by the hundreds of millions annually.

"In my first letter I called your attention to the fact that by using misleading figures in your address to the National Association of Railway Commissioners at Washington in regard to the total annual interest and dividends paid by the railways of this country you had fallen into an error of over $211,000,000. You now admit the justice of this criticism. Referring to the figures used by you and my criticism of them, you say, 'I believe your point is correct that such totals include duplications which should be deducted because of payments to railroads by other railroads resulting from mutual stock and bond ownerships.' Having conceded this, you attempt to show by a wholly different method of calculating that a saving equal to that originally estimated by you could be made, and 'challenge' me to show wherein you may be in error. I have read with mixed feelings of amusement and astonishment the figures given and conclusions drawn in this, your second utterance on the subject. I am unable to decide in my own mind whether the nonsense you write is due to the fact that you are ignorant and are yourself deceived, or to the fact that you are trying to mislead others. In either event it is inconceivable how a man who has succeeded in getting the public confidence to such an extent as to have become chairman of the railroad commission of a great state can be capable of using railway statistics as you did in your address to the National Association of Railway Commissioners and again in your letter to me. You enjoy the unique distinction of being the only railroad commissioner I ever heard of who did not know the difference between an *addition to railway income* and a *deduction from it*. In your address at Washington you gave the total interest and dividends paid by the railways in 1912 as $883,000,000, and in my letter to you I called your attention to the fact that the total net operating revenue of the railways in that year was less than $868,000,000, and that, after paying taxes, they had left only $755,869,486 net operating income. In your reply you say, 'You exclude $255,611,495, representing "other income," as well as $123,898,207 income from non-operating roads. A substantial portion, but not all, of these figures should be legitimately included.' Now, of the $124,000,000 which you assume was *paid by the non-operating roads to the operating roads*, and therefore should be *added* to net operating income, no less than $117,400,000 was *paid by the operating roads to the non-operating roads*, and was, therefore, a *deduction* from the increase of the operating roads! As to the $255,600,000 'other income,' you apparently assume that this was derived from outside investments, and was, therefore, additional to the revenue derived by the railways from their own operations. Here again, you are completely in error. This 'other income' is made up almost entirely of payments of an intercorporate operating or financial character made by the railways to each other. For example, it consists chiefly of the very duplication of interest and dividend payments which you yourself now admit should be eliminated in treating the railways as a single system. The complete figures of the Interstate Commerce Commission for 1912 are not yet out, but those for 1911 are, and by turning to the Commission's income account of all the railways considered as a single system, on page 53 of its Statistics for 1911, you can ascertain by a simple calculation that the total amount of money which the railways had available in that year for interest, dividends, improvements, etc., after making all proper allowances for and deductions from both their operating income and their 'other income,' was $785,297,599, which is about $350,000,000 per annum less than the sum arrived at by adding together the net operating income, the 'other income' and the income of non-operating roads, as you, by implication, suggest should be done to ascertain the total net income of the railways. The mistake made by you in your Washington address as to the total interest and dividends paid by the railways was only $211,000,000. The mistake now made by you regarding their total income amounts to $350,000,000. I grow curious to know how much your mistakes would ultimately increase to if this correspondence should be long continued?

"Having conceded that the estimate originally made by you as to the annual saving that could be made in return to railway capital under government ownership (namely, $464,000,000) must be reduced by at least $211,000,000, you add that even after this deduction the saving which could be made on the basis of your calculations as to what the government would have to pay for the railways and the rate of interest which it would have to pay on the bonds which it would issue for this purpose would be $250,000,000 annually. But, as I clearly indicated in my first letter to you, both your estimate as to what the government probably would have to pay to the railways and your estimate as to the rate of interest which it would have to pay on the debt incurred by it, are too low. Since your premises regarding these matters are baseless, it follows that the conclusions which you persist in drawing from them are absurd.

"Continuing, you call attention to the fact that after paying operating expenses, taxes, interest, dividends, etc., in 1911, the railways had left $161,800,000, which they used for additions and betterments, for the construction of new lines or extensons, carried to their general balance sheet, etc. You add that this would go to the public under government ownership.' But if under government ownership the government should take this money and use it for purpses other than those to which it is now devoted, it would not make the improvements, extensions and so on which are now made from it. In that case, either these improvements, etc., would not be made at all, or they would be made from the sale of additional securities. In the former case needed improvements would be wanting. In the latter case capitalization would be increased faster than now, more money would have to be earned to pay a return on it, and in the long run the public would be worse off than it is under the policy now followed by the railways. The railways of the United States have followed the policy of making substantial expenditures from earnings for improvements from year to year, very little of which has been capitalized, and most of which has gone for improvements of great benefit to the public, but which earns nothing for the railroads—such as fine pas-

Digitized by Google

senger stations, track elevation, elimination of grade crossings, etc., and on June 30, 1911, according to the statistics of the Interstate Commerce Commission, they had outstanding a capitalization of only $63,944 per mile on which to earn a return. The British roads have followed the policy of making all additions and improvements from new capital, and on the same date they had a capitalization of over $275,000 per mile on which to earn a return. The American policy is obviously the less costly in the long run, and, therefore, the saving of $162,000,000 in expenditures for improvements, etc., which you estimate could be made, like the saving in the cost of capital which you estimate could be made, turns out to be purely imaginary.

"You attempt to strengthen your argument for government ownership by saying, 'Remember, the large majority of the civilized countries on the globe—three fourths of them—already own most of their railroads.' You seem to know as little about the railways of the world as about those of your own country. The latest complete compilation of the railway mileage of the world was made by the *Archiv fur Eisenbahnwesen*, the official publication of the Prussian State Railways, as of January 1, 1910; and the figures given by it in its issue for May and June, 1912, showed that the total length of the railways of the world was 639,621 miles, and that of this governments owned only 186,068 miles or 29 per cent, and private companies, 453,554, or 71 per cent. Even excluding the large privately-owned mileage in the United States, the mileage owned by private companies in the rest of the world was 212,497, or 26,429 miles more than the total government-owned mileage. Europe and North America are hardly the least civilized parts of the world; and on these two continents the mileage owned by governments was only 120,040 miles, while that owned by private companies was 380,531 miles, or over three times as great. It is true that most of the mileage of Germany is owned by the states, but all of that of England is owned by private companies. Most of the mileage of Austria-Hungary is owned by the state, but 82 per cent of that of France is owned by private companies. While most of the mileage of Italy, Switzerland, Norway and Australia is owned by the government most of the mileage of Sweden, Portugal, Canada and Argentina, is owned by private companies. Contrary to your apparent belief, and probably to the belief of most persons, private ownership is still decidedly the preponderant policy of the world."

Valuation Not a Remedy for the Rate Question

By FRANCIS DEAN SCHNACKE,
COLUMBIA UNIVERSITY, NEW YORK CITY.

IN view of the fact that Congress has directed the Interstate Commerce Commission to make a valuation of each American railway engaged in interstate commerce, it is well to consider what the utility of such valuations will be for rate regulation, after they have been ascertained

The principal argument is that in this way the regulation of rates will be much simplified; that those, and only those, rates will be reasonable and just which allow the railway in question to earn a "fair return" on the "fair value" of its property. Nearly all economists and students of transportation agree that the general rate of return which railways, as a whole, receive, is one element to be considered in the determination of the reasonableness of rates, but a great difference of opinion exists as to what is the proper method of computing the so-called "fair value" on which the rate of return is based, and also as to what weight should be given the rate of return as compared with other considerations.

Volumes have been written on what elements enter into the determination of value. The Act of Congress authorizing the Commission to make these valuations, requires that there shall be ascertained the original cost of each road, its cost of reproduction new, its cost of reproduction less depreciation, and any other elements that may enter into its value, but leaves it to the discretion of the Commission to decide what these other elements, if any, are, and to decide how the full valuation shall be determined from the information thus obtained.

Even a hasty discussion of what constitutes a "fair value" of a railway would occupy a great many printed pages, but it may be said in passing

FRANCIS D. SCHNACKE.

that neither original cost, cost of reproduction new, nor cost of reproduction less depreciation, of the physical properties of a railway is the proper criterion by which to determine its fair value. A valuation so made might either greatly exceed or fall short of its true value. Not only those elements, but its strategic location, its connections and traffic agreements, its traffic density, the skill and ability with which it is operated and man-

Digitized by Google

aged, as indicated by its net earnings, should also be given due consideration. In short the value that a railway possesses as a going concern is its true value. It would be absurd to say that a railway constructed through a mountainous district, and yielding small dividends is worth more than, or as much as, one with a relatively large earning capacity, situated in a prairie section, merely because the original cost or replacement cost of the former is $75,000 per mile and that of the latter but half that amount. Rolling stock and roadbed costs as much new, or to reproduce, when destined to lie idle half the time, as when used to maximum capacity, but it cannot be said that the value of these properties is the same in the two cases. The Supreme Court of the United States has tersely stated the proper standard upon which to base railway value in the following words: "But the value of the property results from the use to which it is put and varies with the profitableness of that use, present and prospective, actual and anticipated. There is no pecuniary value outside of that which results from such use." *

Even though these non-physical as well as the physical elements be included in the determination of the "fair value" of a railway, of what practical use, for rate regulation, can such valuation be after once ascertained? The highest authorities on transportation subjects agree that the proper test of the reasonableness of the rates of a carrier is not the rate of return on the value of its property. No such rule of thumb is applicable. If it were possible for railways to adjust their rates so as to yield earnings sufficient to meet their fixed charges or to pay dividends on watered stock, receiverships would be unknown. Chairman Knapp, of the Interstate Commerce Commission, testified in 1899, and a host of other eminent authorities on transportation have testified, before and since, that they have never seen a single instance where individual or collective rates have depended upon, or even been influenced by the returns made on capital. Railways earning no dividends at all must meet the rates of their prosperous competitors. Rates to and from non-competitive, as well as competitive points, must be fixed so that the traffic will freely move, irrespective of whether any net profit results therefrom. The courts and the Interstate Commerce Commission do not apply the "fair return" test in rate regulation. In a recent case the Commission held that the mere fact that a common carrier was earning as much as twenty per cent on the original cost of its propery did not justify a reduction in its rates.† Canada Southern Railway Company vs. International Bridge Company is an English case to the same effect.‡

The only true test of the reasonableness of railway rates is the effect which they have on traffic. A reasonable rate on a particular commodity is the charge which the shipper or consumer of that article can afford to pay for the service, and which still encourages the development and growth of the traffic in that commodity. This is entirely irrespective of whether the railway in question is earning ten per cent dividends or nothing at all. If a particular rate is so high that it has a depressing influence on commerce it should be reduced regardless of the railway's valuation or earnings. The Supreme Court of the United States has held that such a reduction is legal, even though if similarly low rates were applied on all freight the road would not pay operating expenses.§

The popular conception of freight rates is that they are a burden on commerce, and the lower they can be reduced the more trade is stimulated. The fallacy lies in the failure to see the identity of interest between the railways and traffic. As a matter of fact commerce is as much benefitted by the greatest possible development of railway communication as the railways are by the increase of traffic to its fullest extent. Each plays for the other the role of the goose that lays the golden eggs. Under freedom of action, the operation of the natural and selfish forces of each stimulates and strengthens the other.

Present railway tariffs are the result of nearly a century of the adaptation of transportation charges to the requirements of trade, with the one end in view of increasing tonnage and profits. Rates fixed by any test other than that of commercial considerations never can and never will automatically adjust themselves to the needs of trade, and the result will be detrimental to both commerce and the railways. Rate regulation then should not be governed by any rule of thumb such as "fair return on fair value." It should be confined to the elimination of discrimination and dishonesty. The administration of the railways should be left alone.

There is, however, one great benefit that will surely be derived from the valuations which the Interstate Commerce Commission will make, and that is that the result will make it evident to the public that American railways, as a whole, are not over-capitalized, and are earning but small dividends. It may thus be instrumental in checking much of the punitive and unnecessary restrictions upon railway operations.

*C. C. C. & St. L. Ry. Co. vs. Backus, 154 U. S. 439, 445.

†Board of Railroad Commissioners of Iowa vs. Illinois Central R. R. Co., (1911) 20 I. C. C. Rep. 181.

‡(1883) 8 App. Cases 723.

§Minneapolis & St. Louis R. R. Co. vs. Minnesota, 186 U. S. 257, 267.

A Woman Tower Operator.

DOWN in southwest Louisiana, at a little railway station ninety-eight miles from the Gulf of Mexico, where the Jasper & Eastern branch of the Santa Fe crosses the Kansas City Southern, stands a rather lonely towerhouse. A woman operator, who is always at her post, handles the levers at night, and she has an exceptionally good record.

Mrs. Millie Diefendorf, signal plant operator at Ludington, La., went to Louisiana several years ago with her husband, who also was a signal plant operator and maintainer, and Mrs. Diefendorf took up the work that she might be with him.

After having studied and fitted herself for the position, application for a position was made. It was with difficulty it was secured, for it was generally supposed a woman was not capable of assuming the responsibility of such a position. However, she was given a temporary position as a trial. That was six years ago, and she has been night operator continuously since that time.

There is not a towerman (or towerwoman) on the system who has a record that will surpass hers. During this period she has not unnecessarily stopped a train or caused a delay of any kind.

The Railway as a Public Servant*

By JULIUS KRUTTSCHNITT,
CHAIRMAN, EXECUTIVE COMMITTEE, SOUTHERN PACIFIC RAILWAY.

THE railway is a public servant. This fact is now as clearly and unreservedly recognized by those who own and manage railways as by those who use their services and regulate them. In a different, but no less real, sense, Congress, legislatures, the Interstate Commerce Commission and state railroad commissions are public servants. The duty of the railway as a public servant is to render good service to the public and charge only reasonable rates for it. The public has given the lawmakers, commissions and some other public officials authority to see that the railways perform this duty

It is evident that if the public is to get satisfactory results from its servant, the railway, it must take care that it be so treated that it will be kept in vigorous health. The railway cannot maintain vigorous health if it is not allowed sufficient earnings to sustain it in good physical and financial condition, or if burdens are imposed on it which are too heavy for it to bear. The immediate determination of what earnings it shall be permitted to receive and what burdens it shall have put on it is in the hands of the other servants of the public mentioned, chiefly the commissions and legislatures. If the railway is guilty of acts of omission or commission which are inconsistent with its public duty, these other servants of the public should adequately restrain and punish it. But when the railway is doing its best to perform its duty it is obviously contrary to the interests of the public for it to be subjected to unnecessary restraints and penalties.

Yet this is what is occurring at the present time. In a recent editorial, the New York *Times* said. "The railways no longer are subject to the reproach of resisting legislation or minimizing its effects and results. Their haughty spirits being subdued, is there not reason and room for hoping that the regulators themselves may realize the responsibilities thrust upon them? Ultimately, the regulators are the people. * * *" Loyal and efficient service to their common master requires that the relations between the railways and the regulating authorities shall be co-operative and governed by a spirit of justice. In no other way is it possible for each to render the efficient service which alone justifies its existence. Why should the master with supreme control over all suffer one servant to be injured and embarrassed by the others in performing his duties?

It is sometimes said that the railway may properly be regulated in this way or that way in which other concerns may not be regulated because it is engaged in a public service. But does not the fact that it is engaged in a public service argue most forcibly for the greatest justice and considerateness in dealing with it? It has dedicated its property to a public use. Is not an obligation incurred by the master to shield from injustice and oppression the servant who has thus dedicated his resources to his service? Is it not even more important to the public that the concern which does serve it shall be considerately and fairly dealt with than that the concern which does not serve it shall be?

JULIUS KRUTTSCHNITT.

When Congress wastes millions of dollars and state legislatures squander millions more, there is hardly a passing comment. The money is easily obtained. It is raised by taxation; and when expenditures increase, whether for good reasons or not, taxes can be and are equally increased. The railroads, equally servants of the public, cannot raise money with such ease and facility. They can get it only by rendering the services of freight and passenger transportation. The national and state governments can make their incomes cover their expenditures because they control both the income and the expenditures. The railways must keep their expenditures within their incomes, because while they have some control over their expenditures they have almost no control over their incomes, their passenger and freight rates being fixed by public authorities. And, while the managements of the railways can to some extent control their expenditures, they cannot by any means completely control them. In consequence, in spite of all the managements have been able to do, operating expenses have been steadily increasing. This has been largely due to advances in wages, practically all of which have been awarded by arbitration boards. Most of these arbitration boards have been organized and have acted under the authority of a federal law, the Erdman Act.

In addition, the lawmakers and commissions have been imposing numerous requirements on the railways which have further increased their ex-

*From *Leslie's Weekly*. Reprinted by permission.

Digitized by Google

penses, and often in ways that have actually reduced the railroad servant's efficiency. Within our knowledge no accidents to railway trains in this country have been proven to be due to their being insufficiently manned. American railways have spent some $250,000,000 in equipping their locomotives and cars with automatic couplers and air brakes, which not only increase safety, but relieve brakemen of the danger and labor of coupling and setting brakes by hand. For some years the railroads enjoyed a return on this very large expenditure, because by reducing the number of trainmen that had to be employed and the total amount of wages that had to be paid it tended to reduce operating expenses and increase net earnings.

But in the past few years state after state has permitted its servants, the legislatures, to decree that additional men shall be employed by the railways in excess of their necessities, whether viewed from the standpoint of economical operation or of public safety. As a resuk of this legislation millions of dollars have been wasted in hiring useless labor—money which might otherwise have been so expended as to replace the cost of railway service or improve its quality. The real purpose of this legislation has been to increase the number of men that railways must employ. The legislatures have, in effect, robbed the railways and given the spoil to unnecessary employes in order that the members of the legislatures might get the votes of railway labor. In allowing one servant to be thus robbed of the fruits of his thrift by a fellow servant, has not the master been clearly at fault? Has he not disregarded not only the rights of the servant who has been robbed but his own interests?

Again, laws have been passed to compel the railways to use special patented headlights on their locomotives. Acetylene headlights of high efficiency and closely approaching the electric headlight in brilliancy and power were already in use. The railways using these efficient and expensive devices were forced to discard them and incur heavy additional outlay for specialties promoted by inventors and private corporations whose claims were strongly advocated by lobbies of promoters and labor representatives whose disinterestedness had not always been above suspicion. Can the master escape responsibility for the waste thus forced on one of his servants by a fellow servant? What would the master think of a law that required him to replace the acetylene lights that he uses in some of his lighthouses with electric lights that served their purpose no better but cost ten times as much? What would the individual citizens of this country who own automobiles think if similar legislation were passed regarding automobile headlights?

The federal government and state after state have passed laws limiting the hours of service and efficiency of railway employes. Since the master permits his other servants to thus impose burdens on the railways, should he not also cause some consideration to be given in the regulation of the rates of the railways to both the necessary and unnecessray burdens imposed on them? The Postoffice Department recently has found itself in a sorry fix, similar to that in which the railways find themselves. The efficiency of its employes has been reduced. In consequence, its expenses have been increased. It has therefore demanded and received a large appropriation to restore the efficiency of the mail service. The railroad is a fellow servant of the Postoffice Department. It, however, cannot thus get an emergency appropriation, but must continue to pinch a narrowly limited income in order to meet the increased expense caused by an enforvced reduction in the length of the working days of its employes. Scores of laws have been passed that increase the outgo of the railways regardless of their income and it often happens that a railway traversing two or more states is beset with conflicting laws in these various states to which it must adjust itself as best it can. Scripture teaches us that no man can serve two masters. How, then, can the railways be reasonably expected to serve forty-nine?

The effect of this unjust treatment of one servant of the public by his fellow servants, which is tolerated and condoned by their common master, is strikingly illustrated by the fact that between 1907 and 1911 the railways of the United States put $2,044,714,000 of new capital into their properties on which they have received no return. Incredible as it may seem, the total return in 1907 on $13,000,000,000 of invested capital was $8,787,000 more than the return in 1911 on $15,000,000,000 of invested capital.

The master and his servants, the regulating authorities, impose many requirements on the railway in the nominal or real interest of safety. The total number of "passengers" killed, including "persons carried under agreement," in train accidents in the year ending June 3, 1912, was 139. In "other than train accidents," the number of passengers killed was 179. Nearly all of these deaths were due to unrestrained personal carelessness; and this, in turn, was due to the master's neglect to require those who use the railway's service to exercise common sense to protect themselves against the necessary hazards of railway operation.

The total fatalities on the railways of the United States in the same year in connection with train operation were 10,195. Of these 5,434, or 53 per cent of the total, occurred to trespassers. These fatalities to trespassers could be prevented by the passage and enforcement of proper laws; and only thus could they be prevented. In other words, the master, through failure to prescribe and enforce preventive measures, was responsible for fifteen easily avoidable deaths every day during the year. In 1907 a train could run 2,900,000 miles before a passenger in the servant railway's care was killed in a train accident. In 1911 it could run 9,100,000 miles, or over three times as far. That is, travel on trains was over three times as safe for passengers in 1911 as in 1907. On the other hand, during the same period there was but a small reduction in the number of fatalities to trespassers in proportion to the number of train miles run. In 1907 one trespasser under the master's care was killed to every 210,000 train miles run, and in 1912 one was killed to every 240,000 train miles run. During this period the servant was diligent and careful, and the master was grossly negligent.

The railway cannot render the service its master expects and demands without sufficient means. There is not a railway manager in the country to-day who is not fearful that under the press of increasing demands the transportation system of the country will in a few years break down unless the railways are allowed to earn larger funds

Digitized by Google

wherewith to build it up. They must have more double tracks, terminals and yards; new and larger stations; they must eliminate grade crossings and make other improvements, to handle the increasing density of traffic resulting from the growth of population and wealth. There are vast sections of the country, especially in the West, where more railroads are needed, and they cannot be built unless the railways can raise new capital. Now, there never was such a world-wide demand for capital as there is at this time. And what are the facts as to the ability of the railways of the United States to get capital? There never was a time when railroad investments were more unattractive. The interest rates that the railways must pay are very high and they are steadily increasing.

People invest money in order to make money; and they are skeptical as to whether they can make money by investing in concerns that are dealt with stringently and unfairly. Railroad securities must be made more attractive to invite investment, and in order that they may be made more attractive the roads must be allowed earnings that will enable them to meet the increasing capital charges. People cannot be induced or forced to put money into enterprises that are discouraged and deadend by the arm of the law. Nor is it sufficient to induce investment that earnings shall be barely sufficient to pay fixed charges and modest dividends. In order that its securities may be salable, a concern must be able to build up a surplus as a defense against financial troubles. This practice is considered praiseworthy and a mark of prudent and efficient management when followed by other concerns, but the policy of the government in this country is to forbid the railroads from following the practice, and if, perchance, one does accumulate a surplus it at once becomes a target for attack.

There was a time when the people took little interest in the details of railway operation. During that period there were many abuses, but the development of railways went forward at a rate which has never been equalled in any other country. It was justifiable and necessary that the public should assert itself to stop the abuses. But it is not necessary in order to stop misconduct on the part of railway managements to destroy the efficiency of the railways and sap their financial strength. The public should understand that in exercising the power, it cannot shirk the responsibility, of the master. The welfare and health and strength of the servant must be conserved if he is to render the service which the master expects and needs.

Passenger Conditions and Their Relations to the Public

By GEORGE W. BOYD,
PASSENGER TRAFFIC MANAGER, PENNSYLVANIA RAILROAD.

EDITOR'S NOTE:—The following address by Mr. Boyd was delivered at the 58th Annual Convention of the American Association of General Passenger and Ticket Agents held in Philadelphia, October 14th and 15th. Its direct bearing on the problems which are so seriously disturbing present day railway management makes it of unusual interest.

THE business of transporting passengers by railroad is scarcely eighty years old. The primitive methods of making rates, as well as of handling the passengers, were inherited by the railroads from the stage coach and the canal boat, and it is by no means improbable that the crudity of such a system, coupled with the common prejudice of the people against the newly found means of locomotion, produced the first feeling of antipathy on the part of the public against railroad management. For nearly fifty years what may be termed the creative period of railroad history continued, and during that period the administration of passenger matters, in the absence of system and the lack of concerted action, was in a chaotic condition. The construction of new lines and the extension of those in existence made competition rampant. The struggle for traffic brought out a multitude of abuses in the devious practices resorted to in the control of traffic. The commission system bloomed and flourished, the scalper became an active force for evil, and the rate wars budded and broke out over night. The passenger man's lot was not a happy one. He was a public enemy unless he yielded to popular clamor. He had to keep a sleepless eye on his competitors to protect his traffic, and present a brave front to his own executive su-

Digitized by Google

periors, who in those days had little sympathy with the passenger movement, and rather considered the passenger department in the nature of a disordered appendix.

To continue this savage strife was fatal to all hope of profit, destructive of business integrity, inimical to the rights of shareholders, and was very unbusiness-like. A great light broke upon the passenger situation, and a finer feeling of fair dealing and honest practices was born. The payment of commissions to agents for the control of traffic was discontinued and gradually eliminated from the situation. The law was invoked to drive the scalper from the field, and the fight against this pernicious enemy of honest dealing was relentlessly fought and won in state after state until he was practically driven from the field.

A surer and more equitable basis of rate making, and a firmer stand in their maintenance, followed these reforms as a natural result. Intercourse between passenger men became more candid and sincere, a higher standard of integrity became the ruling spirit in passenger affairs, and the administration of passenger business in all its complex details assumed a place in railroad affairs which not only increased the earning power of passenger transportation, but elevated the passenger branch of the traffic department in importance, dignity and influence. As we look back now on the record of passenger history in the last twenty-five years it seems clear that the leaders of the reform movement in the conduct of passenger business were unconscious forecasters of coming events. They were wisely strengthening their lines and concentrating their forces in preparation for the new conditions which national and state legislation was bound to force upon them.

It counted for nothing that during years of honest and continuing endeavor the passenger officials had striven to so regulate their business as to give the public, without favor or preference, the benefits and advantages of equitable and fair rates and superior passenger service. That old and lingering prejudice against railroad interests had waxed stronger in the public mind and reached a point of such intense and widespread hostility as to demand of the national law makers restrictive and regulative legislation against the railroads. This widespread sentiment took shape and form in the first Interstate Commerce Act, creating the Interstate Commerce Commission, which undertook to regulate the conduct of all railroad business in its relations to the public. On account of the conservative measures which had been put in practice in the ten years preceding the enactment of this law, the majority of the railroads were prepared to adopt its provisions without serious interference to their revenues. The abolition of passes in fact tended to increase them, and the anti-discriminatory features of the bill served to still further strengthen the integrity of the rate situation and uphold the policy of a fair deal to all the people. The significant fact that very few prosecutions have been instituted for the infraction of the national laws against passenger traffic officials, is ample proof that passenger men are law-abiding citizens, and ever ready and anxious to perform the obligations of the railroad to the public to the fullest extent.

In 1906, the Hepburn bill, amending the original Interstate Commerce Act, was passed, and in 1910 the Hepburn bill was further amended to its present form and scope.

The Interstate Commerce Commission, reconstructed under this act, with enlarged powers, has practically taken over the rate-making duty of the railroads. Its powers in this respect are more than regulative,—they are mandatory. Interstate rates are required to be fixed on certain principles prescribed by the law, and the Commission is constantly on the alert to see that the requirements of the law are strictly observed. Rate making therefore has its legal status. It cannot be juggled to the advantage of one line over another. The will of the people, as expressed through their representatives, is paramount. The people have tied up the transportation lines, and forces them to sell their product at a price that the purchaser determines. It is an anomalous situation. Ordinarily the law of supply and demand fixes the price of a commodity, but railroad transportation is sold to the people at what they think the price should be, without regard to the cost of production. The glaring inconsistency and manifest unfairness in this situation, places the transportation lines at the enormous disadvantage of having the price of their product definitely fixed by an overruling power, without any aid or authority from this power to regulate or control the expense of producing it. The law says you shall not charge any more than a fixed maximum rate for transporting passengers, but it does nothing to help you in fixing a reasonable scale of wages for the workmen required to perform the service you must render to the public. As far as established rate regulation is concerned it is therefore a one-sided affair, with all the odds against the railroads. There can be no question of the wisdom of a governmental regulation of passenger rates under wise and well-considered legislation. It undoubtedly helps the railroads to escape those abuses against which they fought for so many years before the law took an active hand in the matter. But the public, for whose benefit all the regulative legislation is designed, fail to appreciate that they have the railroads backed into a corner, hemmed in on the front by the law, and on the flanks by the insistent and extravagant demands of labor.

It should be remembered that national legislation is not the only restrictive force that confronts the railroads in their operation. Every law making body in the country, from the tiny borough council to the halls of Congress, is active in the general movement. Every ruling or enactment of each one of these bodies affects the earning power of the railroad by increasing its expenses. Uncomputed millions of dollars within the last decade have been added to the cost of performing transportation by the innumerable laws imposed upon the railroads by the people. The epidemic of two-cent bills which swept over all the states materially reduced the revenues of many lines unfairly. The full crew bills, which force upon the railroads a large number of useless employes, will swell the wage account by millions, without giving the public any corresponding benefit, and to the actual loss of the operating departments. The restrictive laws affecting the hours of labor, added to the constantly increasing cost of labor, the imposition of much higher taxes, and the proposition of putting the cost of the elimination of grade crossings exclusively on the railroads, is a cumulative drain on their revenues, which will eventually become sharply manifest in the reduction of dividends.

Digitized by Google

All these multiplied forms of added expense have a direct bearing on the capacity of the roads for performing adequate passenger service. It follows as a natural consequence that if passenger operation cannot be counted on to supply its proper proportion of revenue on account of the low rates enforced, the high standard of passenger service must be lowered. This would prove a most unfortunate hindrance to railroad progress. For thirty years, even during the period of rate instability, there has been a gradual but uninterrupted improvement in equipment and in the essential features of the passenger service in general. In response to the public demand, high-grade trains, with accommodations not dreamed of a generation ago, have been introduced, multiplied and maintained in the highest state of efficiency. Years ago the appointments and speed of American trains compelled the admiration of the world. At the present time they have reached the climax of superiority. All-steel cars of every class provide not only every requisite of comfort and convenience, but insure the maximum of comfort and safety. The modern locomotive, with its enormous power and possibilities of speed, makes regularity of movement the rule instead of the exception. Terminal stations, notable in architecture, lavish in spaciousness, convenient in accessibility, stand as convincing proof of the purpose of the railroads to give the public the perfection of service in every detail.

The transportation of person and property by railroad is the greatest business in the world. It touches more points of human activity than any other organized business. Its intimate relations with trade, commerce, the household, society in general and the government, make it the one indispensable factor of modern existence. With this vast multiplicity of connections with the vital affairs of life, it is necessary that its administration should demand the keenest tact and the wisest judgment. The record of passenger transportation proves that such characteristics are conspicuous in the administration of passenger affairs on our American railroads. The passenger officials of our railroads, as evidenced by the membership of this body, are able, broad and highminded men, specialists in their profession by education and experience. Keenly alive to the responsibilities imposed upon them by the ethics of business and the requirements of the law, they are fully competent to serve their corporate masters with loyalty, and the public with equity and justice. No passenger man wishes or tries to deprive the public of any of its rights. On the contrary his aim is to interpret the law under which he works as liberally as possible, so that the people may enjoy the benefits of every advantage modern railway management can provide for them. If the public could be convinced that the railroads are striving to give the service it demands, as far as possible within the law, and under the burden of expense imposed by the law, it can hardly be doubted that sentiment in this regard would become more favorable to the corporate interests of the country. The American people in the end are always fair, and if they can be brought to realize that railroad management is honestly endeavoring to fulfill its obligations to the law of the land, and at the same time serve the best interests of the people, who are primarily responsible for the laws, they will be less eager for lower passenger fares when demanding improved passenger service. Thousands of these people are investors in railroad securities, and the promptings of their own self-interest must sooner or later influence them to give the railroads a square deal.

I feel assured that this Association is of one mind in its desire to enlighten the public to a proper realization of its responsibility in these matters. Railroads cannot go on forever paying dividends if their earning power, already weakened by low rates, is to be still further eaten into by high wages, high taxes, and the numberless other expenses that a compliance with the existing laws entails.

It is the plain duty of every member of this body to bestir themselves, jointly and individually, to use their best endeavors to educate the public mind to the importance of popular support and encouragement to railroads, in order that the best interests of all concerned may be conserved.

By practice and precept, by speech and by working, they can sow in the public mind the seeds of a better feeling toward railroad management. By a rigid adherence to the legally authorized rates, they can prove to the public that everybody dealing with the railroads is on the same footing, and that no advantage is enjoyed by individual or organization.

By instilling into the minds of all employes the principles of efficiency, and courtesy, and consideration, in all their dealings with the public, they can make a long forward step toward winning and holding the confidence of the people.

With the popular distrust of the corporate interests turned into confidence, the active support of the people will undoubtedly be given to all well-managed railroads throughout the country.

Panama-Pacific Exposition.

RAPID progress continues to be the feature of the work on the Panama-Pacific Exposition. The great exhibit palaces now rapidly rising and the numerous lesser structures of many kinds combine to form an Exposition City of striking effect, in the process of making. Each day reveals progress in its evolution that is little short of amazing, when the vast scope of the undertaking is considered.

More than 6,000 applications for concessions have been received to date by the Division of Concessions and Admissions, and more than 100 have already been granted.

One hundred and seventy-seven congresses and conventions of various organizations have been arranged for the exposition year in San Francisco, and negotiations are in progress with many more organizations in different parts of the world, for some of the congresses will be international, others national and others yet pertaining only to the Pacific Coast of the United States. The organizations that have already agreed to hold congresses and conventions in San Francisco in 1915 include those representing civic, religious, social service, educational, fraternal, business, labor, commercial, horticultural, livestock and other interests.

The most conservative estimates, by careful investigators, place the minimum attendance at the Panama-Pacific International Exposition at 10,000,000, while most of them place the total at figures varying between 12,000,000 and 18,000,000.

Fire Protection Applied in a Broad Sense to Railroad Properties

By CHARLES N. RAMBO, OF PHILADELPHIA.

EDITOR'S NOTE:—The Railway Fire Protection Association was organized in Chicago on October 7th, and thirty-nine representatives were enrolled as members. While this is a good beginning it is hoped that all the principal railroads will become interested and identified with this Association in order that every effort may be made to bring about a reduction in the fire waste on railway property. The following paper by Mr. Rambo, read before the organization meeting, gives an excellent idea of the importance of this subject and the great amount of money which can be saved as the result of the proper development of a concerted movement of this character.

THE subject of fire waste in this country is receiving such careful consideration and attention on the part of those interested in the conservation of property and property values, and the question of the prevention of such waste has shown such a marked development in the course of the last decade, that it is reasonable to presume and right to state that it has not been overlooked by the managements of the leading class of corporations dealing with commerce, such as the transportation companies of the country, and having such large property values at risk of fire. It is possibly needless to impress my thoughts upon those who have been studying this vast subject and who are assembled here in the organization of an association which will have for its prime purpose the promoting of interest in and the improvement of the methods of fire protection and prevention in such class of properties: but it is rather for us, in the joint consideration of these subjects, to enlist a more general and comprehensive study of them by the railroads and secure an even greater co-operation in the establishment of such practices and safeguards as will lessen the opportunity for loss of property and life by fire in the future.

The enormous values invested in railroad property, aside from right-of-way, roadbeds, etc., and the large liabilities involving the carriers, can be readily comprehended. It is fair to assume we are dealing with a problem affecting billions of dollars in property value. When we glance at the enormous growth of the transportation lines in this country in the last twenty-five years and with the careful study now given by such corporations to all phases of safety and economy in operation, it can readily be seen that the question of fire protection and prevention should play no small part, for aside from the destruction of values brought about by fire losses there is always the incidental and consequential interruption of operations. The nature of the business of transportation companies requires that more than ordinary precautions be taken to safeguard against and keep free from the interruption to their operations which fire loss and damage cause. Such interruption naturally varies with the importance of the property. As an illustration we might cite the destruction by fire of an interlocking tower with the subsequent detention or interruption in train service on up to the large terminal and shop properties, dislocating the machinery of transportation and requiring readjustment involving far-reaching consequential details.

Possibly one of the marked features we, who have been making a study of these subjects, may have encountered, and an important thought brought to our attention, is that in the upbuliding of the transportation lines the question of permanency could not always be taken into consideration, and with the rapid growth and added requirements and necessary changes from time to time the question of conservation of properties has not been as seriously considered as it otherwise might have been. Railroad properties in the early periods were often crudely constructed but of such a character as to supply the requirements of the times, and neecssarily structures were found to have been built on very economical and not durable lines. With later stupendous and permanent growth of traffic, territories becoming thickly settled and fixed, and with the expansion of the large trunk systems, improvements have been made to meet the changed and more fixed conditions and the work of rebuilding or erection of new structures, as with roadbeds, has been studied and presented on a more advanced and higher standard, and enormous sums of money have been expended in improved building construction of the modern period.

CHARLES N. RAMBO.

We cannot but feel impressed with the enormous fire waste of this country which averages approximately $200,000,000 per year and we realize the fire loss in railroad properties plays its

Digitized by Google

part in such waste. In the study of protection against and prevention of such loss we are confronted necessarily with a mass of detail in the proper comprehension of the subject and it is obvious that such essentials should be carefully studied out and such uniformities and standards adopted as will be helpful in curtailing to a large extent the bad experience of the past.

We find in railroad properties a multiplicity of operations involving large values, varying from the usual hazards incident to rail transportation to the large repair and construction plants, including machine shops, planing mills, foundries, blacksmith shops, boiler shops, upholstery shops, carpenter and pattern shops, paint and car repair shops, locomotive erecting shops; all with their varied processes and the ordinary and special hazards involved; and the terminals with their large merchandise piers and freight houses, storage warehouses, coaling piers and so on to the minor properties along the line including freight and passenger depots, signal and interlocking towers, coaling and water stations.

The subject of fire protection in a broad sense includes that of fire prevention which, as distinguished from the term fire protection, concerns the removal of the causes of fires.

The essential features to be considered by those who study the problem of fire protection are:

First. To so construct buildings on fire-resisting lines as to minimize the possibility of fire starting and prevent its unrestricted spread and opportunity for serious loss. The proper time to guard buildings against loss by fire is during their construction. One of the reasons why this is not always done, unfortunately, is on account of the initial cost. We must encourage the use of fire-resisting materials, the division of large areas as far as possible and the protection of buildings exposing each other. We have too frequently seen a class of buildings on railroads that is apt to furnish fuel for large conflagrations.

Second. To prevent fire from starting through the reduction and safeguarding of hazards inherent to the particular property. Elimination of the possibility of fires starting should be as carefully considered as the question of good construction and protection.

Third. To provide adequate private and public facilities for extinguishing a fire should it start and be prepared to fight a small fire before it becomes dangerous. All of the expense met with in the installation of fire fighting equipment, water supplies, etc., can be counted as naught if the means to promptly use it is not trained and ready, and if it is not properly cared for and kept in serviceable condition.

We might therefore summarize the important factors in connection with these subjects briefly by asking ourselves the following questions: Are the materials used in constructing buildings incident to this class of property such as will prevent the possibility of combustion or the spread of fire? Are prompt means used to detect the presence of fire? Can the fire be promptly and definitely located? and, Are there ample facilities, directed by trained bodies of men, for extinguishing a possible fire in its incipiency?

There is an indifference on the part of some corporations to the adoption of methods in general use for the protection of their properties against loss by fire. It is obvious what this would mean in event of fire starting.

The theory and practice of fire prevention and protection is a scientific study, including that of general construction, architecture, physics, economics, mechanics, hydraulics, electricity, chemistry, manufacturing processes and fire protection engineering.

One of the first demands in connection with the study of fire prevention is that of good housekeeping, involving a multiplicity of detailed enforcements that will insure it through a large property as a matter of daily duty and through which means the possibility of fires may be largely avoided. This can be accomplished by the appointment of employes in each portion of a property with such authority as may be necessary, to see that cleanliness is observed and through the posting of official notices in prominent places requiring the carrying out of fire protection rules so prepared as to meet conditions usually found in railroad properties.

The protection of properties against fire is an important part of the duty of every officer and employe. Every fire in railroad property should be made the personal responsibility of some employe. It must be remembered that the majority of fire losses are preventable and that they are largely a matter of lack of cleanliness and carefulness and that the great study of prevention must be along these lines.

An important part of the organized work such as can be undertaken by this Association is to obtain from actual experience statistical facts bearing on losses and the causes thereof and to educate along the lines as to the details of causes and as to the care and vigilance necessary to counteract them, so that a reduction in fire loss may be brought about. A knowledge of the causes of losses is essential for the proper comprehension of fire dangers. Many properties may have been immune from loss but frequently there lurks the opportunity for serious damage. Each cause should be fully understood and the necessary remedy applied. The matter of causes is a very broad subject and one requiring special study.

A very good classification of hazards, recently made by a prominent insurance official, divided them into physical, moral and temperamental. Those which are particularly applicable to railroad properties, I believe, are the physical hazard and the temperamental hazard; the first including such as are inherent in the property and its use, such as construction and the hazard of operation: the second including that which would be attributed to carelessness which produces fires, not purposely, but those which could have been prevented by a study of the causes of fires, with less indifference as to the effects which follow or as to the remedies to be applied.

With the consideration of the subject of building construction and the careful and systematic guarding of the housekeeping and operation to reduce or avoid hazards, we include that of fire extinguishing apparatus. This subject necessarily is one of great detail and brings out the study of the extent and character of the properties and the natural conditions surrounding them, and their use and occupancy. The class of appliances will necessarily cover a wide range, starting, however with the idea of having an ample supply of water to meet the maximum of conditions that might arise. Careful study is necessary to determine the specific character of fire extinguishing devices required to meet the demands of each class

Digitized by Google

of property. These include the use of a system of automatic protection which is the best class that may be considered and which is recognized as the only one producing the maximum of efficiency and success in controlling fires; water mains and fire hydrant systems under ample volume and pressure from public or private reservoir or other source of supply, with incidental fire pumps, elevated tanks, standpipes, fire hose, fire extinguishers, steam jets, sand pails, water barrels and pails; all of which must be studied and installed with a due regard to their relative values. An important fire fighting agency on railroad properties is the locomotive or yard engine used at terminals and large yards remote from public protection so equipped for supplying water with the aid of fire hose as to give good service in event of fires in rolling equipment and its lading.

Fire alarm systems are an important factor, particularly in large properties, to obtain prompt use of fire appliances through the prompt summoning of drilled employes and municipal departments.

The success of the fire prevention idea must be due entirely to well organized forces in all departments. Without system and organization through the help and authority of executives or the general management such matters cannot be made an important factor with the men. The prevention of the occurrence of those things which hinder or retard the progress of operation or which are a menace to life and property is brought about or is reduced by education through instructions, rules, etc., issued under an executive order. In this way co-operation is secured amongst the rank and file.

Fires, like accidents, happen at unexpected times. Continued vigilance is therefore essential and without a general co-operation and knowledge of dangers we cannot escape their consequences.

The organization of the fire prevention and protection work on railroads must be undertaken with intelligence and a due regard to local conditions. It is necessary that the importance of the work be recognized by all in authority, the chief executives, the general manager, superintendents foremen and agents in charge of property: all educated to the idea that there should be harmony of action. Education as to fire prevention requires thorough publicity that all employes may be advised of its scope and that it may reach all parts of a system and that the old and prevalent idea of security against fire damage may be eliminated.

With the large values involved and elaborate expenditures made for devices and appliances for fire extinguishment, it is important that the furtherance of the organization idea should be pushed for its intelligent and prompt use, without which the expenditures are of no avail when manual use is required of the equipment. Therefore in order to have the appliances serve the good purpose that was intended, it is necessary to so perfect the organization as to get the greatest amount of value therefrom.

Fires, even though promptly discovered, can very often not be handled by employes because of lack of fire fighting equipment or lack of knowledge of how to handle it, and because it is quite usual in such contingencies for people to "lose their heads." Fires have to be scientifically and carefully sought out and fought. Experience has shown that the efforts of undrilled employes, however well intended, will not control a fire as promptly as a disciplined force, made familiar with the protective apparatus by regular drill and practice.

Rigid and systematic inspection of all fire apparatus should also be made by specially delegated employes, preferably members of fire brigades, at least once a week; everything down to the smallest piece of apparatus should be in its place and in good order ready for use, and a report of such inspection should be made to those in authority.

Fire prevention committees, fire marshals, chiefs or captains of fire brigades are all necessary parts of an efficient organization and the inspection of buildings and their valuable contents for fire hazards by such committees or members of fire departments should not be treated in any light manner. Members of fire departments, possibly uniformed or otherwise designated with authority, should be especially delegated to make at least weekly inspections and report to the authorities in charge on the conditions, and day and night watchmen should patrol all parts of the property for the same purpose, having their tours properly recorded on approved devices, to secure efficiency.

There should be monthly conferences of officers or local committees at which matters of general interest might be considered with a view of continuing efforts for substantial improvements, for with all reasonable precaution there is still the factor that relaxation may be fatal.

In passing I might add that the improved construction in railway rolling equipment should eventually work a great factor of saving in the loss by fire on railroads for a large part of their loss has been brought about through inflammable construction of equipment and character of its lading. With the reduction in the amount of inflammable equipment and as for methods of transportation in connection with hazardous commodities under the direction of the Bureau of Explosives, fires may be restricted in large congested yards.

All of these subjects must necessarily receive special consideration and treatment. I have merely tried to point out certain broad essential facts that must be taken into consideration to comprehend the requirements for the conservation of property and the lessening of the possibility of loss to it and life through fire and the consequential results thereof.

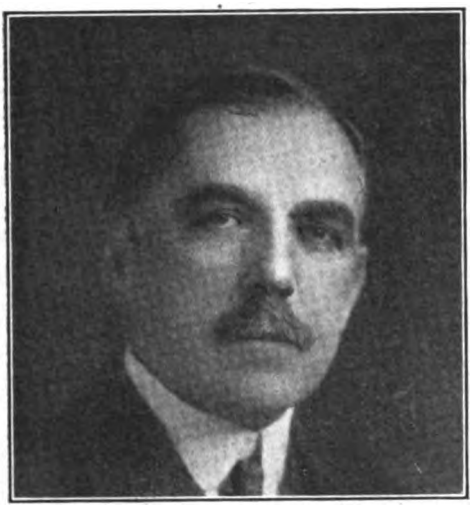
Personal



Alfred H. Smith.

ALFRED H. SMITH, senior vice--president of the New York Central Lines, has been elected president of the New York Central and Hudson River and Lake Shore and Michigan Southern Railroad companies to succeed William C. Brown upon the latter's retirement on January 1. He also was made a director in these corporations. Election as head of the subsidiary lines will take place as the various meetings occur.

The career of Alfred H. Smith, in many respects, has been similar to that of Mr. Brown, whom he will succeed, in that each entered railroading in humble positions, and through hard work, wide experience and ability attained places of high executive importance. Mr. Smith began as a messenger boy in Cleveland for the Lake Shore and Michigan Southern Railway in 1879. Later, he worked for a time in the office of the purchasing agent, and then resigned to join a construction gang engaged in the change of grade and reconstruction of the Lake Shore west of Toledo. In this work he was engaged for several years, becoming foreman and then general foreman in construction work.

In 1890 Mr. Smith was made superintendent of the Kalamazoo division of the Lake Shore and Michigan Southern and successively was made superintendent of the Lansing, Franklin, and Michigan divisions. In 1901 he was appointed assistant general superintendent of the Lake Shore and then general superintendent. A year later, in 1902, he was transferred to the New York Central as its general superintendent.

His appointment as general manager of the New York Central came in 1903 and in 1906 he became also a vice-president. On April 15, 1912, he was made vice-president of the lines west of Buffalo, with jurisdiction over operation, maintenance and construction of all lines in the New York Central system, east and west of Buffalo, with the exception of the Pittsburgh and Lake Erie west and the Boston and Albany and Rutland roads, east of Buffalo.

It was in March of this year that Mr. Smith became senior vice-president of the New York Central Lines. This extended his jurisdiction over all of the roads included in the system and over all departments. He is in his 50th year.

In its new executive officer the New York Central Lines have a man thoroughly familiar with all its features of operation and management. His record has been one of steady advancement and the various positions which he has successively held has given him an experience and a grasp of company affairs that splendidly qualifies him for the important and weighty responsibilities which will devolve upon him after the first of the year.

Fairfax Harrison.

ON December first, Fairfax Harrison, formerly vice-president of the Southern Railway Company and for the last three years president of the Chicago, Indianapolis and Louisville Railway Company, of which the Southern is part owner, was elected president of the Southern Railway Company to succeed the late William Wilson Finley, a special meeting of the Board of Directors being held for the purpose of filling the vacancy caused by Mr. Finley's death.

Mr. Harrison is a Virginian, his home being at Belvoir, Virginia. He is peculiarly identified with the South, as his father was private secretary to Jefferson Davis while president of the Confederate States, and all his railroad experience has been with the Southern and its associated lines. Mr. Harrison was born in 1869, and was graduated from Yale with the A. B. degree in 1890, and from Columbia with the A. M. degree in 1891. He was admitted to the bar in New York in 1892 and continued the practice of law in this city until 1896, when he entered the service of the Southern Railway in the legal department as solicitor. In 1903, he was made assistant to the president, and in 1906 became vice-president, which position he held until 1910, when he resigned on being elected

FAIRFAX HARRISON.

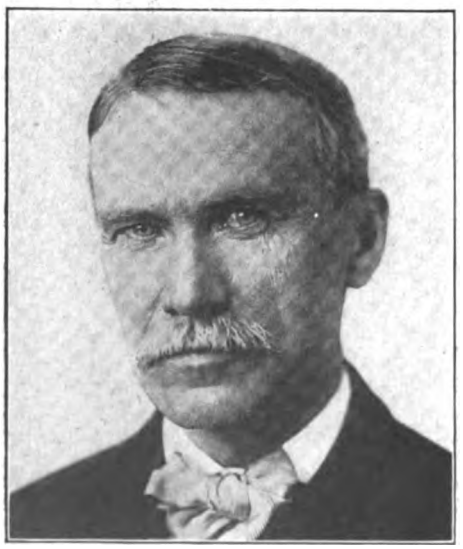
Digitized by Google

president of the Chicago, Indianapolis and Louisville. He, however, continued as a director of the Southern Railway so that his service with the parent company has been uninterrupted.

Mr. Harrison was one of Mr. Finley's closest and most trusted advisors and is thoroughly in sympathy with the policies which made Mr. Finley's administration so successful both for the Southern Railway Company and the territory served by its lines. Though Mr. Harrison entered the service of the Southern in the legal department, his experience has not been confined to that branch of the service. He has given much study to financial, traffic and operating problems and is intimately acquainted with the conditions on the Southern Railway and throughout the section which it traverses. As president of the Chicago, Indianapolis and Louisville, he was actively in charge of the operation of the railway, so that he comes to the Southern Railway prepared by practical experience as well as the most detailed knowledge of the details of its affairs to take up the duties of chief executive. Mr. Harrison was also elected president of the Alabama Great Southern Railroad, the Mobile and Ohio Railroad, and Virginia and Southwestern Railway.

Resolutions deploring the death of Mr. Finley and paying a high tribute for his work for the railways he headed and the territory they served were adopted by the Board of Directors of the Southern Railway, the Mobile and Ohio Railroad, the Alabama Great Southern Railroad and the Virginia and Southwestern Railway. These resolutions will be printed throughout the South. Immediately following his election, President Harrison gave out the following statement :

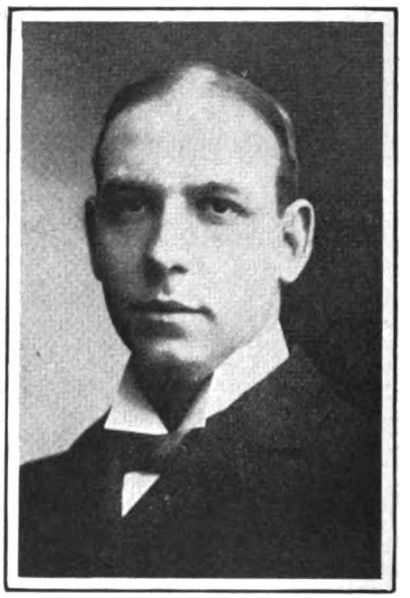
"I am in entire accord and sympathy with the policies of my lamented friend, Mr. Finley, under whom I have worked for seventeen years. I hope to continue to build the Southern as he built it by promoting and enhancing its usefulness to and its cordial relations with the people of the South. I count on the support of the entire present working organization of the Southern, rank and file. Having grown up in the service with most of them, I know how to value them and I am proud to believe that they are my friends."



JOHN B. BAIRD.

John B. Baird.

JOHN B. BAIRD, who on November 1 became freight traffic manager of the Northern Pacific, was born June 21, 1855, at Woodlawn, Md. He began railway work in 1876 as a clerk in the general office of the Pennsylvania, at Philadelphia, Pa. Afterwards he went to the Chicago, St. Paul, Minneapolis and Omaha as clerk for the general manager, and subsequently was employed as rate clerk in the general freight office of the Northern Pacific. Later Mr. Baird was promoted to assistant general freight agent of the latter road, in which capacity he served until May 1, 1903. He was then made general freight agent, which position he held until he was appointed freight traffic manager, with headquarters at St. Paul, Minn.



Francis B. Choate.

FRANCIS B. CHOATE, who has recently been appointed assistant general freight agent of the Union Pacific Railroad, has been in the service of the Union Pacific Railroad since 1888, starting at Omaha; then traveling freight agent out of Omaha for Nebraska and Wyoming; traveling freight agent at Portland, Ore., and at Sacramento for some years; then general agent for the Union Pacific at Salt Lake City in 1897, then transferred to general agency at Pittsburgh in 1901; then as general agent of the Union Pacific and Southern Pacific in that city at the time of consolidation in 1901; then transferred as general agent of both companies at Detroit, coming to this city May 20, 1910, as general agent of both freight and passenger departments, giving up the passenger department in February, 1911; since that time general agent of the freight department until present appointment.

F. E. Connors.

F. E. CONNORS, who has been made assistant to Vice-President W. E. Hodges, of the Atchison, Topeka and Santa Fe Railway, with headquarters at Topeka, Kansas, was

Digitized by Google

born October 6, 1869, at San Francisco, California. Educated in the public schools. Entered railway service August 15, 1886, with Chicago and Alton Railroad as office boy in the purchasing department, Chicago, Ill., since which he has been consecutively, July, 1887, to October, 1888, clerk in the stationery department; October, 1888, to October 20, 1890, stationer; October 20, 1890, to May 15, 1891, clerk in the stationery department of the Atchison, Topeka and Santa Fe Railroad, Topeka, Kans.; May 15, 1891, to May 21, 1895, chief clerk; May 21, 1895, to October, 1900, clerk in the purchasing department Chicago; October, 1900, to September, 1901, assistant chief clerk; September, 1901, to January 1, 1907, chief clerk; January 1, 1907, to November 15, 1913, assistant general purchasing agent; November 15, 1913, to date, assistant to vice-president in charge of stores.

J. E. Allen.

J. E. ALLEN, who has been appointed assistant general freight agent of the St. Louis Southwestern Railway Company, with headquarters at St. Louis, was born April 6, 1879, at Louisiana, Mo. He was educated in the public school and entered railway service in 1905, since which he has been consecutively to October 1, 1898, in general freight office, Missouri, Kansas and Texas Railway Company, at St. Louis, Mo.; October 1, 1898, to January 1, 1901, in freight claim department, St. Louis Southwestern Railway Company, at St. Louis; January 1, 1901, to June 1, 1906, in general freight office, Missouri, Kansas and Texas Railway Company, at St. Louis; June 1, 1906, to June 1, 1908, chief clerk to general freight agent, same road, same place; June 1, 1908, to June 1, 1909, assistant general freight agent, St. Louis Southwestern Railway Company of Texas, at Tyler, Texas; June 1, 1909, to date assistant general freight agent, St. Louis Southwestern Railway Company at St. Louis.

M. H. Jacobs.

M. H. Jacobs, who has recently been appointed assistant general freight agent of the Western Maryland Railroad with headquarters at Pittsburgh, was born in Waynesboro, Pa., 1877. He entered the service of the Western Maryland on October 1, 1893, at York, Pa., as messenger boy, and in December of the same year was transferred to the commercial freight agent's office as soliciting freight agent. In February, 1904, he was made traveling freight agent at Baltimore and in August, 1912, was appointed general agent at Pittsburgh, which position he held until his recent appointment.

D. G. Gray.

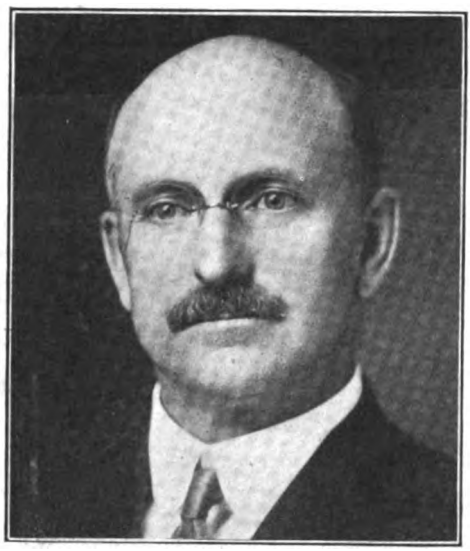
D. G. GRAY, who has been reecntly appointed general freight agent of the Western Maryland Railway, received his education in the Ohio State University. He began his railroad career with the Baltimore and Ohio in 1887 in the office of the division freight agent at Columbus, Ohio. In 1896, he was appointed chief clerk in the office of the general freight agent of this road at Pittsburgh, and in 1902, became division freight agent at Columbus. In July, 1905, he returned to Pittsburgh as division freight agent in which capacity he remained until 1910, when he was promoted to general freight agent of the company at that point. He resigned on December 31, 1912, owing to poor health but again entered railway service with the Western Maryland on March 1, 1913, as general western freight agent at Pittsburgh, becoming general freight agent of that company at Baltimore on November 1st.

Alexander S. Greig.

ALEXANDER S. GREIG was born in Aberdeen, Scotland, October 25, 1860. Served an apprenticeship in a mercantile establishment in Scotland. In 1880 he came to America, and was with a mercantile establishment in London, Canada, for a little over a year, when he moved to Colorado and served two years in the purchasing department of the Colorado Fuel and Iron Company. His first railroad work was with the Denver and Rio Grande in the purchasing department in 1883. He was then transferred to the mechanical department as secretary to the superintendent of motive power, and until 1895 was with the Denver and Rio Grande Railroad as chief clerk in the mechanical and operating departments. In 1895 he went to the Santa Fe, Prescott and Phoenix Railway in Arizona as trainmaster, and in 1897 he went to the El Paso and Northeasten Railway as general superintendent, remaining in that office until 1902 when he became general superintendent and traffic manager. During that year he took up the promotion of a sanitarium for the care of tubercular patients in New Mexico. January 1, 1903, he went to the Rock Island and was in the office of the president on special work for three years. In 1905 he was appointed assistant to President of Frisco Lines. In 1907 was made assistant to chairman of the Executive Committee of the Rock Island-Frisco Lines. In 1909 was made vice-president of the Frisco lines in charge of purchasing and disbursement of materials, etc., and of the land grant lands belonging to that company. On May 1, 1911, in addition to his duties as vice-president, he was appointed assistant to the president, Frisco lines. At the time of the receivership of the Frisco lines he was appointed assistant to the receivers, and on November 15, 1913,

Digitized by Google

in addition to his duties as assistant to the receivers, was appointed first assistant to the chief operating officer, which position he now holds.



E. I. Grenfell.

E. I. GRENFELL, who was recently appointed auditor of the Fort Worth and Denver City Railway Company with headquarters at Fort Worth, Texas, was born in 1865 at Dodgeville, Wisconsin. He began his railway work in Jannary, 1883, with the Union Pacific, being employed as local agent until December, 1893, when, owing to receiverships and segregation of properties, went with the Union Pacific, Denver and Gulf, which was reorganized in 1899 as the Colorado and Southern. Entered the auditing department April 1, 1899, as traveling auditor; in September, 1902, became joint accountant, and in December, 1906, was made chief clerk. July, 1907, was appointed assistant general auditor, which position he held until appointed auditor of the Fort Worth and Denver City Railway, and consulting auditor of The Wichita Valley Railway, Fort Worth, Texas, October 20, 1913.

Daniel Joseph Brumley.

D. J. BRUMLEY, who was recently appointed assistant chief engineer of the Illinois Central Railroad and the Yazoo and Mississippi Valley Railroad, with headquarters at Chicago, was born in 1865, at Belmore, Ohio. After taking a course in civil engineering at the Ohio State University, he entered railway service in 1895, as assistant section foreman for the Louisville and Nashville Railroad and in 1896, he was made assistant engineer of the Columbus and Hocking Valley Coal and Iron Company, and in the latter part of that year, became assistant supervisor of the Louisville and Nashville Railroad at Belleville, Ill. In May, 1907, he was appointed rodman of the Louisville and Nashville at Louisville, Ky. and in March of the following year, became assistant engineer of that road with headquarters at Clarksville, Tenn. In 1898, he was transferred to the chief engineeer's office at Louisville, and in 1901 he became associated with the Mexican National Railroad as roadmaster at Laredo, Texas, but in the latter part of that year, he again became associated with the Louisville and Nashville Railroad as roadmaster at Elizabethtown, Ky. In 1904 he accepted a position as division engineeer of the Indianapolis Southern Railway at Indianapolis, Ind., and in 1905, became principal assistant engineer of the Illinois Central Railroad and the Yazoo and Mississippi Valley Railroad at Chicago. In 1910 he was made engineer of construction of these lines and in 1913 engineer maintenance of way, which position he held until his recent appointment.

Thomas W. Hulme.

THOMAS W. HULME has been appointed real estate agent of the Pennsylvania Railroad, succeeding Benjamin W. Carskaddon, deceased. Mr. Hulme was born near Mout Holly, N. J., on August 11, 1868. He received a public school education, and later entered the University of Pennsylvania, and received from that institution the degree of B.S. and C.E. He entered the service of the Lehigh Valley, in the real estate department, in 1890. During the period of the lease of the Lehigh Valley by the Philadelphia and Reading, February, 1892, to August, 1893, he was in the real estate department of the latter company, and also in the president's office. He returned to the service of the Lehigh Valley upon the termination of the lease and was made assistant real estate agent, remaining in that position until June, 1904, when he entered the service of the Pennsylvania Railroad in connection with the work of the real estate department in New York City. In November, 1904, Mr. Hulme was made assistant real estate agent of the New York Connecting Railroad, and on May 1, 1905, was appointed assistant real estate agent of the Pennsylvania System East of Pittsburgh, and was transferred to the general office in Philadelphia. Upon the formation, in May, 1913, of a committee of eighteen railroad presidents to look after the interests of the railroads in connection with the valuation of their properties by the Interstate Commerce Commission, Mr. Hulme was elected general secretary of the presidents' committee and was furloughed in order that he might so act.

Obituary

W. W. Finley.

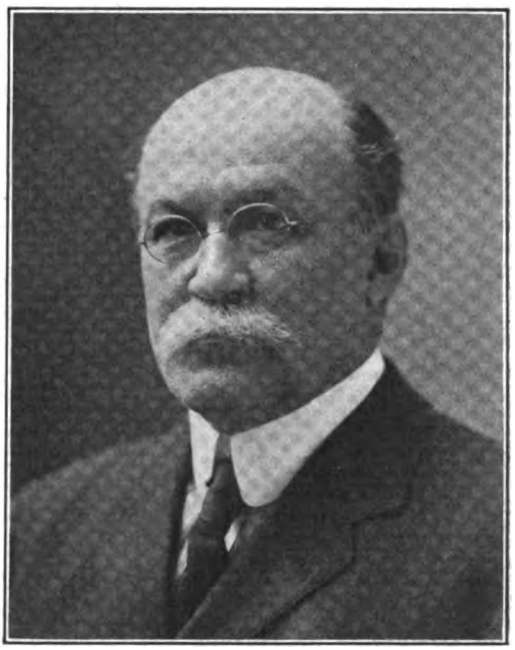
IN the death of William Wilson Finley, president of the Southern Railway, which occurred suddenly in Washington, on November 25th, that great system has lost a chief executive who has done more for its material welfare than any of his predecessors.

When Mr. Finley succeeded Samuel Spencer in 1906, he found the Southern Railway in a nearly bankrupt condition. His wonderful appreciation of the situation in which he recognized the imperative necessity of up-building the territory through which this system operated, has not only resulted in its complete rehabilitation, but has brought an abundant blessing to the people of the South.

Mr. Finley possessed a profound knowledge of economic affairs, was a fluent talker and his enthusiasm in the future of both the Southern Railway and the Southern people, was unbounded. It would be hard to measure the value of this one man's constructive genius to the Southern States, but the farm and the factory have felt it to a remarkable extent. The South had come to love and trust him and each year brought to them a fuller appreciation of his wonderful ability. His loss is irreparable and the deep feeling of regret everywhere manifested, constitutes one of the highest public tributes ever paid a railroad official.

Mr. Finley was born at Pass Christian, Miss., September 2, 1853. He was educated in the public schools of that place and on May 1, 1873, entered the service of the New Orleans, Jackson & Great Northern and the Chicago, St. Louis & New Orleans as stenographer to the vice-president. After three years' service in this position he was for nine months secretary to the receiver; secretary to the agent for the trustees for one year, chief clerk, general freight department, for four years, and assistant general freight agent for three years. From March 1, 1883 to December 15, 1885, he was assistant general freight agent of the Texas & Pacific Division of the Missouri Pacific, and from that time to July, 1886, was assistant general freight agent for the receiver of the Texas & Pacific. He was then appointed general freight agent, which position he held until September, 1888, when he took the position of general freight agent of the Pan Handle Route, comprising the Fort Worth & Denver City, the Denver, Texas & Fort Worth and the Denver, Texas & Gulf.

In May, 1889, Mr. Finley was made chairman of the Trans-Missouri Traffic Association at Kansas City, Mo. From October 1, 1890, to May 20, 1892, he was chairman of the Western Passenger Association at Chicago. He then entered the service of the Great Northern as general traffic manager. He left this position April 10, 1895, to become commissioner of the Southern States' Passenger Association at Atlanta, Ga. He first became associated with the Southern Railway on October 1, 1895, as third vice-president. On May 15, 1896, he returned to the Great Northern as second vice-president, but remained with that road only four months, returning in September as second vice-president. On December 5, 1906, he succeeded to the presidency of the Southern, which he filled to the time of his death. In addition he was president of the controlled lines—the Alabama, New Orleans & Texas Pacific; Georgia Southern & Florida; Mobile & Ohio; Northern Alabama; Southern Railway in Mississippi, and Virginia & Southwestern.



W. W. FINLEY.

Mr. Finley is survived by his wife, three daughters and a son, the latter being connected with the Pennsylvania Railroad. In 1910, the University of Tulane conferred on President Finley the degree of LL.D. He was chairman of the board of directors of the Bureau of Railway Economics at Washington and was a director of the Chicago, Indianapolis & Louisville Railway, of the Old Dominion Steamship Company and several other enterprises.

Thomas M. Emerson.

BY a strange and sad coincidence the railroads of the South, on the same day of Mr. Finley's death, sustained another severe loss in the demise of Thomas Martin Emerson, president of the Atlantic Coast Line Railroad, who passed away suddenly at his home in Wilmington, N. C., almost immediately after his return from a trip of inspection with the directors of his company.

Mr. Emerson was unquestionably one of the most prominent traffic men of the South, having been for twenty-three years head of the traffic department of the Atlantic Coast Line. It was in 1905 that he became president and under his guidance and broad policy of extension, improvements have been steadily carried on which have included the construction of a large amount of double track and the re-laying with heavier

Digitized by Google

rails of a large portion of the system. Modern stations have been erected at many points, steel trestles constructed and better rolling stock installed, all of which has resulted in bringing the road up to a very high standard.

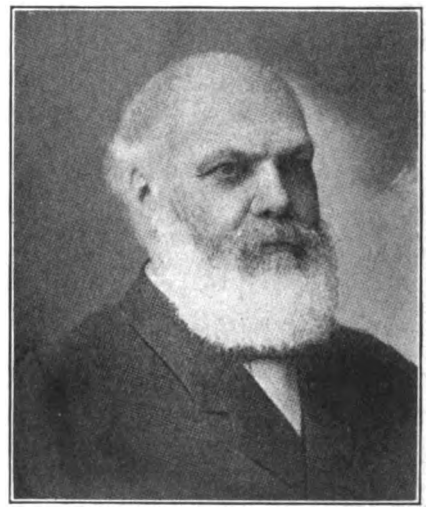
Mr. Emerson, like Mr. Finley, has always had a keen appreciation of the necessity of more fully developing the natural resources of the South, particularly those of agriculture, and the active work of this character, carried on under his supervision has proved highly beneficial to that section of the South through which the Atlantic Coast Line operates. Each year has seen a large number of new industries established and a steady influx of new settlers who are constantly being educated along agricultural lines through the operating of good roads trains, agricultural trains and farm demonstration trains.

Mr. Emerson was born in Preble County, Ohio, March 29, 1851, and began railway service in Indiana as a freight clerk at the age of sixteen. He worked on the Fort Wayne, Muncie & Cincinnati and the Charlotte, Columbia & Augusta (now a part of the Southern) and was a telegraph operator a part of the time. His first position on the Atlantic Coast Line was that of chief clerk in the general freight and passenger department in 1875. In 1881 he left and went to the Chesapeake & Ohio as assistant general freight agent, but he stayed only a year and then returned to the Atlantic Coast Line, and from August, 1882, to July, 1891, he was general freight and passenger agent of that road. He was then made traffic manager. In November, 1902, he became vice-president in charge of traffic, and three years later, November 21, 1905, was made president.

John H. Marble.

JOHN H. MARBLE, the youngest member of the Interstate Commerce Commission, and also the youngest in length of service, died suddenly at his home in Washington, on the evening of November 21st, at the age of 46. Mr. Marble was taken sick while conducting a hearing in Philadelphia. Mr. Marble was born in Ashland, Neb., February 26, 1869, and was educated at the University of Nebraska. He went to California and was admitted to the bar in that State in 1903. While living in San Francisco he became acquainted with Franklin K. Lane, now Secretary of the Interior, and when Mr. Lane went to Washington as a member of the Interstate Commerce Commission he soon engaged Mr. Marble for the service under that body. In 1912 he succeeded Edward A. Moseley, as secretary of the Commission; and a year later, when Mr. Lane took a place in the cabinet, was appointed by President Wilson to succeed Mr. Lane as a member of the Commission. At a public hearing held by the Commission in Washington on November 24th, Chairman Clark, observing that the commissioners, if they followed their personal inclinations, would suspend business for a time, paid a warm tribute to the personal character of Mr. Marble, whom he praised as a man of genial, helpful and splendid personality, indefatigable industry, sterling integrity, and broad fair-mindedness.

JOHN H. MARBLE.



James Charlton.

JAMES CHARLTON, chairman of the Transcontinental Passenger Association, died November 19th at his home in Chicago, at the age of 81 years. He had been ill since the death of his wife about four weeks previous. Mr. Charlton was born May 15, 1832, at Bothal, Northumberland, Eng. He began railway work in England in April, 1847, in the freight department of the Newcastle & Carlisle Railway at Newcastle-on-Tyne, where he was successively junior clerk, chief clerk and cashier, until March, 1857. He then came to Canada, and from April 29, 1857, to 1870, was employed by the Great Western of Canada as assistant to chief clerk in the audit office, in charge of statistics and freight accounts, and as chief clerk, auditor and general passenger agent. In March, 1870, he accepted a position as general ticket and passenger agent of the North Missouri, and in July of the following year he became general passenger and ticket agent of the Chicago & Alton. He held this position for almost 29 years, resigning January 1, 1900. In October of that year, Mr.

Digitized by Google

Charlton was made chairman of the Transcontinental Passenger Association. Two of Mr. Charlton's sons are in railway service, George J. Charlton as passenger traffic manager of the Chicago & Alton, and Alexander D. Charlton as assistant general passenger agent of the Northern Pacific at Portland, Ore. Train service on the Chicago & Alton was suspended for three minutes on November 21st in honor of Mr. Charlton.

Horace I. Bettis, for the past ten years auditor of the San Pedro, Los Angeles & Salt Lake, with headquarters at Los Angeles, Cal., died at Tipton, Cal., November 15th. Previous to July, 1903, Mr. Bettis was for two years assistant general auditor of the Union Pacific.

T. E. Brown, assistant general passenger agent of the Boston & Maine R. R., died at his home in Concord, N. H., October 25th.

James Hagerman, former general counsel of the Missouri, Kansas & Texas Ry., died in St. Louis, Mo., November 14th, aged 65 years.

Joseph E. Harris, formerly agent of the Union Line of the Pennsylvania system at Indianapolis, Ind., died in that city, November 13th, in his sixty-eighth year. Mr. Harris was in the active service of the Pennsylvania Lines for 38 years, and has been on the pension roll since August, 1, 1911.

Frederick A. Haskell, formerly general freight agent of the New York Central & Hudson River R. R., died November 3rd at his home in Brooklyn, N. Y.

W. P. Johnson, formerly from 1880 to 1887, general passenger agent of the Lake Shore & Michigan Southern, died at his home in Chicago, on November 16th. Mr. Johnson was born at Whitehall, N. Y., in 1834, and entered railway service in 1852 with the Western Vermont. He was subsequently with the Chicago, Burlington & Quincy, and in 1854 became a clerk in the office of the general ticket agent of the Illinois Central at Chicago. The following year he was made general passenger agent of that road, which position he held until June, 1880, when he resigned to go to the Lake Shore.

C. E. Pfender, auditor and traffic manager of the Chicago & Illinois Western R. R., died at Chicago, on November 16th.

Matthew J. Ramsey, chief clerk to the general manager of the Pennsylvania Railroad, died on November 9th, at his home in Overbrook, Pa. He was born in Newark, Del., on April 1, 1849, and began railway work as a telegraph operator at Perkiomen Junction on the Philadelphia & Reading in 1866. Five years later he entered the service of the Pennsylvania Railroad as a telegraph operator at Pier No. 2, New York City. He was transferred to Philadelphia, the following year, and in July, 1874, was appointed telegraph operator in the general manager's department. He served as a telegraph operator, and later as a clerk until February 10, 1897, and since that time had been chief clerk of the general manager's department.

Milton C. Roach, who was for eighteen years general eastern passenger agent of the New York Central & Hudson River at New York City, died on October 31st, at Montrose, Pa. He was born on September 20, 1852, at Erie, Pa., and began railway work in 1873, on the Canada Southern, now a part of the Michigan Central, as clerk in the purchasing department. He was then successively bill clerk in the freight office, chief clerk of the ticket accounts in the auditor's office, passenger agent and city ticket agent at Detroit, Mich.; passenger agent for Michigan, western passenger agent and general northern and southern passenger agent. He then served in the passenger department of different roads until he went to the New York Central in January, 1886, as general agent in the passenger department, at Buffalo, N. Y. The following year he was made general eastern passenger agent at New York, and in September, 1904, was promoted to assistant general passenger agent of the same road, remaining in this position until he resigned and left railway work, in 1907.

Charles H. Smith, traveling freight agent of the Chicago, Indiana & Southern, with headquarters at Minneapolis, Minn., died on November 4th, aged 58 years.

W. A. Vaughan, former general superintendent of the Southern Railway, died recently in Atlanta, Ga. Mr. Vaughan, who was born in Vermont had been in railway service since 1870 principally with the Michigan Central R. R. and Southern Railway.

Financial

An Unsatisfactory Situation.

RECENT developments have thrown a gloom over the financial outlook. The tariff, the proposed currency legislation, the plight of the railroads and their constantly decreasing net revenues, the general feeling of uncertainty which appears to prevail throughout the industrial field, all combined have exerted a depressing influence whose full strength has been thrown upon the security market. The failure of the New Haven System to declare its regular quarterly dividend, and the recent statement of Commissioner Prouty at a dinner of the Lotus Club in New York to the effect that the carriers need not expect a full measure of relief until their financial operations came more directly under the supervision of the Government, have also added to the feeling of depression which, at the present time, is nation-wide in its influence. The encouraging feature of the situation is that the feeling of discouragement now prevalent does not really spring from fear of industrial or financial collapse, but is largely political in nature. Conditions are fundamentally sound and business would only require the slightest encouragement, to regain its normal activity.

No one who really understands the situation, however, doubts that a denial of the carriers' request to increase their rates, would seriously retard the return of prosperity, if it did not actu-

Digitized by Google

ally bring about panic conditions. The recent utterance of Mr. Prouty as well as certain published statements by Mr. Brandeis, intimate that the question of interlocking directorates is to play an important part in the rate hearings and has led to the belief that it may cause the defeat of the rate advance. We do not share this belief. While the existence of so-called interlocking directorates may be proven, Mr. Brandeis and his associates will have to show in addition the detrimental effect of such influence upon the actual prices paid for supplies, before such argument can be logically used to defeat the railways' request for increased rates.

So far as the tariff is concerned, the fear of an invasion of foreign goods on any large scale is being dissipated, as imports are not reaching the figures which were anticipated before the passage of the bill. There is apparently a disposition on the part of foreign manufacturers to take a conservative attitude on account of a doubt as to whether the bill, as it now stands, will be continued through the present and succeeding presidential terms. Both time and money are required to establish new markets and unless these markets can be considered permanent, it is hardly worth while to make the effort. Certain it is that the tariff propaganda is really the action of a minority party and it would not be at all surprising if the next four years saw such an overwhelming change in popular sentiment on this question as to practically undo all the work of the present Administration.

At the present writing the currency bill still continues to be the absorbing topic in financial circles and there is still expressed a fear that the measure as finally passed will be so unsound as to cause grave distress. However, the bill is constantly being subjected to amendment and it can at least be hoped that many of the objectionable features will be eliminated. It is useless at the present time to criticise any particular point, as the different items under review are constantly being reshaped. The Administration is making every effort to have the measure finally passed by Congress before Christmas. It may be said in general that the bill has been strengthened very materially by putting more responsibility upon the proposed Federal Board which will have to determine the number of regional reserve banks as between eight and twelve, and will also have discretionary power to determine or continue national banks that, at the expiration of one year, have not come into the system. It is understood that Secretary McAdoo has privately expressed his intention to hold back the funds of the National Government in order that he may apply them as needed to assist the present national banking system in making transfers of reserves to the new reserve banks without financial or business disturbances. It would appear that the great danger of the bill as it now stands, is that of inflation by billions without the proper regulatory powers of control of rates and reserves with the Federal Board or with the Government. There is little probability that the bill, as now shaped, will, upon its inauguration, produce either contraction or panic.

Reverting again to the railway situation, statistics recently compiled show that despite the fact that $659,000,000 additional money has been spent on improvements since 1910, the net corporate income is fully 10 per cent less than in 1910 and nearly 17 per cent less on capital stock. These figures prove in a very definite manner, that if the railroads are not to be forced out of private control, they should either be allowed to reduce wages or increase rates. As the former is practically out of the question, it is to be hoped that the Commission will appreciate the carriers' difficulties and render them prompt assistance.

The attitude of the Administration towards big business is another question which is receiving more or less discussion and attention by the public press. Up to the present time, however, there have been no radical tendencies displayed in this direction and Mr. Wilson's recent message to Congress shows no desire on his part to unduly interfere with business other than to see that corporations shall operate in harmony with the law.

With regard to the situation in Mexico, it is reassuring to know that the President's own view is a hopeful one. He believes that the present Government is about to fall and that in a short time we may hope to see constitutional order restored by the concert and energy of those of her leaders as prefer liberty of their people to their own ambitions. In any event, the President's message does not show any immediate disposition on the part of this country to actively interfere, and it thus relegates the influence of the Mexican situation on business, for the present at least, to a relatively unimportant position.

As to business in general, there seems to be marked depression in the machinery, iron, steel, lumber and some branches of the textile trades. Many business men are expressing firm conviction that the year 1914 will prove to be a period of considerable dullness. It is interesting to note, however, that a general depression of trade is reported throughout the world and, according to the general average of trade activities throughout the United States, our American industries are suffering comparatively less than those of other nations.

October Railroad Results.

REPORTS to the Interstate Commerce Commission from 170 roads for October, show total operating revenues of $1,054,039,491 as compared with $1,027,280,045 for October, 1912. Net operating revenues for the same months were $332,700,918 for 1913 and $359,921,099 for 1912, indicating a loss for October of the present year of over $27,000,000.

As to operating results of the Northwestern roads for October, including the St. Paul, North Western, Burlington, Great Northern and Northern Pacific, they were generally unfavorable as compared with the corresponding month of a year ago, both as regards the gross and the net. Only two of these companies were able to show any improvement in gross, while all sustained losses in net. The showing of these companies is not exceptional, as practically every railroad in the country is suffering from the effects of a general slowing down in business and small crop movement.

The Stock Market.

IT is hardly necessary to state that the stock market during November was in a highly unsatisfactory condition. Lower levels were generally reached in all prominent stocks, while the number of daily transactions were with few

Digitized by Google

exceptions, extremely small. The passing of the New Haven dividend caused a violent break in the market which extended to many railway securities. New Haven began paying dividends in 1873, and for twenty years thereafter, maintained a 10 per cent rate. In 1894, it fell to 9 per cent; in 1895 to 8 per cent, which it continued until the early part of this year when dividends were cut to 6 per cent on the basis of 1½ per cent quarterly. The failure of this road, therefore, to recently declare its quarterly dividends, has placed it temporarily, at least, among the non-dividend paying railways.

After the decision of the Board to pass the quarterly dividend, Chairman Elliott made public the following formal statement:

"The New Haven is a strong company, owning valuable property, real estate and securities worth many millions of dollars. Some of this real estate and the property represented by the securities and the securities themselves can in time, be marketed, and thus strengthen the cash resources of the company. It is very difficult to sell property and securities at this time, and the directors believe it is unwise to attempt to do so until general conditions are better.

"During the calendar year 1913, the road had already paid dividends of five per cent amounting to $8,657,361.50. For the four months of the fiscal year, July 1 to October 31, 1913, the income available from all companies upon which the New Haven can draw is, in round numbers, $3,390,000; estimating that the net income for November and December will be $500,000, makes a possible total income for six months of $3,890,000. Deducting from this the 1½ per cent dividend, $2,356,768, paid September 30, leaves $1,533,231, all of which is required for working capital.

"The company is now entering upon those months where the volume of business is apt, under normal conditions, to be less than during the months July to November, inclusive. The arbitration of wage disputes in the last eighteen months has resulted in increases in pay that will increase expenses for the present fiscal year between $800,000 and $1,000,000. The improvements to which the company is already committed, in the interest of safety, efficiency and greater convenience to the public, will take large sums of money.

"The directors feel, therefore, that the welfare of the company, of its stockholders and of the territory served by the various lines will be conserved better under all the conditions now confronting the company by not declaring at this time a dividend."

Regarding resumption of dividends, Mr. Elliott said: "We are letting the future take care of itself."

As expected in well informed quarters, the American Express Company has declared a quarterly dividend of 2 per cent which compares with the previous quarterly rate of 3 per cent and places the company upon an 8 per cent per annum dividend basis as against 12 per cent which has been paid for a number of years.

The action of Adams Express Company, a fortnight ago, of maintaining dividends at the rate of 12 per cent, in view of the uncertainty of the future of the express transportation business, had the effect of creating a doubt in the minds of many as to whether American Express would make any reduction after all in its dividend; but well informed quarters are of the belief that the action taken by American Express directors, in the light of developments, is by far the wiser course of the two companies, whose dividends for so long have been consistently on a 12 per cent basis.

Declaration of the regular 1¼ per cent quarterly dividend by the New York Central and Hudson River Railroad Company was in direct line with expectations of those well informed regarding the affairs of the property. For the past few days rumors had been current in Wall Street that the rate would be cut to 4 per cent, but in official quarters little attention was given to the report. The rate of dividend paid by the company for the past couple of years has been 5 per cent per annum, 5¼ per cent in 1011; 5¾ per cent in 1910; 5 per cent in 1909; 5¼ per cent in 1908; 6 per cent in 1907, and 5 per cent from 1900 to 1906, inclusive.

According to those familiar with the situation, it is expected that the company for the fiscal year to end of December 31 next will show a substantial surplus over and above dividend requirements. There was a surplus of about $2,750,000 for the calendar year 1912, $4,160,000 in 1911, $925,000 in 1910, and $4,760,000 in 1909. In 1912 the company earned 6.23 per cent on its outstanding capital stock, contrasted with 6.87 per cent in 1911; 6.41 per cent in 1910, and 7.67 per cent in 1909.

Up to the close of October the company had recorded an increase in net operating income of about $1,300,000, as compared with the corresponding ten months of the previous year. In October there was a net loss of nearly $600,000, compared with October last year. Therefore, if the company were to sustain losses of the October proportions during the remainder of the year, the net would still be as large as in the previous year. There will, however, be an increase in interest charges for the 12 months, as a result of the sale of a considerable amount of short term securities since January 1 last. It is impossible, however, as yet to make an accurate estimate of the probable showing for the full calendar year.

In view of the recent suspension of the New Haven's dividend and the important changes which have taken place in the dividends of a number of other transportation companies, it is of interest to note the extent of present-day stock ownership. According to a compilation recently made by the *Wall Street Journal*, 46 prominent roads of the country, which show share capitalization exceeding $5,000,000,000, have 425,000 shareholders. For these 46 roads the average holdings are 118.7 shares.

Range in Stock Prices.

THE following diagram prepared by the *Magazine of Wall Street*, from the combined averages of fifty railroad and industrial stocks published by the New York *Times*, graphically illustrates the declining tendencies in stock prices during the recent months and particularly during November. The market was extremely quiet during this month and the number of transactions unusually small. While the minimum average was not so low as it was for either June or July, the maximum was far below that of any month for the present year, or in fact for a number of years.

Big Drop in Capital Issues.

COMPLETE returns of new securities announced by railroad and industrial corporations during November according to the New York *Journal of Commerce* indicate a total of only $87,027,000, against $140,082,000 in the same period a year ago, a decrease of $53,055,000. The railroads issued $67,063,000 of bonds, short-term notes and stocks, while the industrials put out $19,964,000. It cannot be too strongly emphasized that our records of security issues includes sums raised to pay off maturing obligations and to refund different issues, so that allowance should be made for this in an effort to arrive at a total. As bearing on this point, it may be well to note that the November maturities amounted to $25,061,500, while those for December are estimated at $45,807,000.

The figures given below were compiled by *The Journal of Commerce and Commercial Bulletin* and summarize the actual issues of new securities for November, compared with the corresponding month of 1912:

RAILROADS.

	1913.	1912.	Changes.
Bonds ...	$20,155,000	$30,774,000	— $10,619,000
Notes	46,008,000	61,543,000	— 15,535,000
Stocks ...	900,000	17,000,000	— 16,100,000
Total ..	$67,063,000	$109,317,000	— $42,254,000

INDUSTRIAL CORPORATIONS.

THE BOND MARKET.

According to the *Wall Street Journal* the average price of twenty-five representative railroad bonds declined nearly a full point to 83.975 during the past month. The average stands at a lower figure than at the end of any previous month of the year or for any year since 1907.

As compared with the lowest prices reached by bonds about the middle of June this year the average is now up little more than 1½ points; and as compared with the lowest 1907 panic prices, when the average stood at 79.08, railroad bonds are now up less than five points.

The average price around the end of each month for the past six years has stood as follows:

While the whole situation is uncertain, many bond dealers profess to see indications of better conditions ahead. Expectations of easier money after the first of the year is, of course, the basis of such expectations and there has been some slight improvement in prices recently. This is accounted for largely by the fact that the declines in November carried railroad bonds to within two points of the June low averages and therefore tended to somewhat stimulate the market during the early part of December.

It is reported that arrangements have about been concluded by the Lehigh Valley for the sale of $10,000,000 of its general consolidated mortgage gold bonds, due May 1, 2003, to Drexel and Company, Philadelphia bankers, their fiscal agents. The bonds are part of an authorized issue of $150,000,000 of which over $26,000,000 are now outstanding.

Authority to issue $10,696,000 4½ per cent equipment trust certificates at 93½ has been asked by the New York Central Lines in Ohio, from the Ohio Public Utilities Commission. These equipment trusts are part of an authorized issue of $24,000,000 of which about half were sold a year ago.

The Illinois Central Railroad has sold to Kuhn, Loeb and Company $10,000,000 Illinois Central and Chicago, St. Louis and New Orleans 5 per cent joint refunding bonds. It is understood that about one half of the bonds will be placed abroad. They are part of a total issue of $120,000,000 which the stockholders have recently approved.

At a regular meeting of the directors of the Canadian Pacific Railway on December 8th, a trust fund was created to be known as "The Special Investment Fund," made up of deferred payments on land sales and securities in which cash proceeds of land sales are invested to the aggregate of $55,000,000. The Royal Trust Company of Montreal is named as trustee of the fund. It is also decided to offer to the common stockholders of record December 23, 1913, in proportion to their respective holdings or a ratio of five to one, $52,000,000 of note certificates carrying interest at 6 per cent per annum payable semi-annually, at a price of 8 per cent of their par or face value. The road will redeem all of the note certificates on their face value on or before March 2, 1924, but these note certificates may be redeemed in part by drawing at any time when the trustees had funds in hand for the purpose.

Sir Thomas Shaughnessy, president of the Canadian Pacific Railway Company, when asked why it was necessary to raise so large a sum as proposed at the recent meetnig of the board of directors, stated:

"The company is not short of funds by any means, its bank account being of very comfortable proportions, but it has for many years been the company's policy to be strong in its cash resources, and, considering the magnitude of the enterprise, this is manifestly prudent.

"Works of improvement, now in progress, to provide for the company's traffic, will require a considerable sum to finish. The additional railway mileage constructed and nearing completion represents an expenditure of upwards of $40,000,000. To meet this expenditure the directors have authority to issue and sell 4 per cent consolidated debenture stock, but this is not the time to go into the market with a large issue of that security to the prejudice of the commanding position that it has always had in the London market, and will again have when normal conditions are restored. Any issue of debenture stock, excepting such small amounts as may be required to meet the demands of the market, must be postponed until some more opportune time. Neither would an increase of the company's capital stock be desirable just now.

"In view of these circumstances the directors decided to ask the shareholders to loan the company the money likely to be required for its purposes during the next year or two on terms that would be advantageous to them, and the issuance of $52,000,000 of note certificates was determined upon accordingly.

"When the proceeds of land sales, to an amount exceeding $62,000,000 had been invested in the property the land assets were permitted to accumulate, and these now constitute the special investment fund of $55,000,000 that has been set aside and ear-marked as applicable only to the principal and interest of the note certificates.

"Of course, it goes without saying that were the company to go into the market to borrow money on its own credit in the ordinary way, better terms could be arranged, but this was a special transaction between the company and its shareholders, and it was intended that the shareholders should have the distinct advantage to which they are entitled.

"These note certificates will constitute no permanent charge against the company's revenue, indeed, they make no demand whatever on the income from the company's traffic. It is a debt that will obliterate itself in the course of a few years.

"The unsold lands and other extraneous assets will remain undisturbed for the future benefit of the shareholders, and it is evident that the income from them will be sufficient for the purpose to which it has, for some years, been largely devoted."

Revenues and Expenses for September.

THE Bureau of Railway Economics at Washington has issued its regular monthly bulletin which contains a summary of revenues and expenses of steam roads in the United States for the month of September. Returns for this month reduced to a per mile of line basis and compared with the returns for September, 1912, show an increase in operating revenues per mile of 2.6 per cent, but an increase in operating expenses per mile of 7.3 per cent. Net operating revenue per mile was less by $26, or 6.0 per cent, than for September, 1912, while that for September, 1912, was 5.1 greater than for September, 1911. These tendencies are extremely disquieting and indicate the desperate situation in which the carriers will soon be placed, unless some suitable

provisions are made for augmenting their net revenues.

The accompanying diagrams show the individual and cumulative monthly revenues and expenses per mile of line for the first nine months of the present calendar year as compared with those for 1912.

Condition of the Boston and Maine.

SAMUEL M. Felton, president of the Chicago Great Western Railroad, who was engaged by directors of the Boston and Maine Railroad to make a thorough investigation of the financial and physical condition of the property, has completed his report. In his report Mr. Felton says:

"The question is: Can the property earn enough to meet its fixed charges pending the completion of the program outlined? The situation is serious. The rate increases are absolutely necessary and should be secured at the earliest possible date. If the result does not re-establish the need of the company and make possible the refunding of the short term notes due in February and June and the procurement of the additional funds necessary to meet the recommendation in this report the prospects are to say the least discouraging.

"Every effort has been made to find a solution of this problem that would not involve an in-

Digitized by Google

crease in rates without result. A careful study of the passenger traffic indicates clearly that much of it is being conducted at a loss and that in the aggregate it contributes but little beyond its share of operating expenses. What is earned toward the fixed charges and dividends is largely contributed by the freight business but this contribution as the reports disclose is entirely inadequate.

"The freight traffic, owing to the excessive service performed, is not yielding a sufficient return. No improvement in operating results is possible that would contribute anything of importance to meet the situation now confronting the property. The money must first be secured before it can be spent, and if all of the funds required were for the coming to-morrow the work in contemplation could not be done in time to reflect in the operations of the property within a year, and even then not in a sufficient amount to meet the situation that is now facing the Boston and Maine Railroad to-day.

"As pointed out all through the report no relief can be secured under existing conditions except through an advance in rates primarily. It is with regret that this conclusion has been reached."

Net Loss Recorded By Texas Roads.

H. G. Askew, statistician for the principal Texas railroads, has prepared a summary of business results for thirty-one Texas railroads, comprising about 90 per cent of the mileage of the state, for the three months ended September 30, 1913, as compared with the three months ended September 30, 1912.

The total operating revenue of these thirty-one lines of railroad for the year ended September 30, 1912, $28,889,344.25, and for three months ended September 30, 1913, the total operating revenue was $29,395,902.84, an increase of $506,558.59

The operating expenses for the three months ended September 30, 1912, was $20,997,892.07, and, for the three months ended September 30, 1913, the operating expenses were $22,396,245.88, an increase of $1,398,353.81.

Thus, while the income increased $506,558.59, the expenses increased $1,398,353.81.

There was a decrease of $891,795.22 in net operating revenue as compared with the three months of the previous year. In addition to the increase in operating expenses, taxes increased $204,668.61 over the corresponding three months of the preceding year, and rents, hire of equipment, etc., showed material increases.

The statement shows a net loss for the three months ended September 30, 1913, as compared with the three months ended September 30, 1912, of $1,487,735.54.

"When it is considered that the Texas railroads had a net loss of over $3,000,000 for the year ended June 30, 1913, the results for the first three months of the fiscal year beginning July 1, 1913, presents a grave situation," says the report. "The public of this age cannot successfully transact business without adequate railroad facilities, and it would seem that the railroads cannot indefinitely continue to furnish such adequate facilities at a loss and without a steady increase of their revenues commensurate at least with the increased expenses of operation."

Report of the National Railways of Mexico.

THE annual report of the National Railways of Mexico for the fiscal year ended June 30, 1913, shows some of the ravages of war, but does not of course reflect conditions to-day. The last five months probably have been harder on the road's earnings and equipment condition than the Madero revolution, but nevertheless in the twelve months ended with June 30 last 1,351 freight cars and 33 passenger coaches were destroyed, while the locomotive equipment was reduced by 15, the company having on hand June 30 but 18,492 freight cars, 553 coaches and 729 locomotives.

Gross income for the fiscal year was $57,370,282, Mexican, against $61,447,790 in the preceding year. Operating expenses were not proportionately lower, showing $36,243,946, against $38,453,254. The net revenue of $21,345,612 compared with $21,888,033, but the increase in the interest charges on the bonded debt increased $1,218,433, leaving a surplus of but $723,561 against $2,484,576 the preceding year and $4,527,830 in the year of the Madero uprising. The operating expenses were increased by maintenance of equipment, but the impracticability of repairing much of the right of way which was damaged, held down the expenditures for maintenance of way, lowering them from $11,340,034 in 1911-12 to $8,076,628 in 1912-13. The cost of conducting transportation increased from $15,435,621 to $16,102,979.

Operation

Greater Safety.

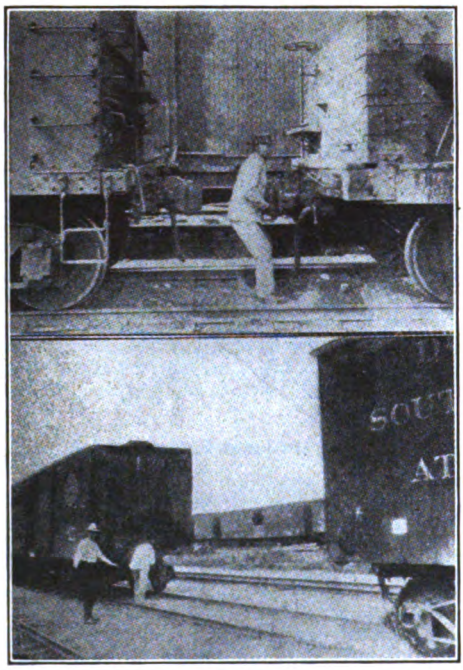
THERE is apparently no decrease in the spread of the greater safety movement which has now become such an important factor in railway operations. Not only do individual roads continue to attack this problem in a vigorous manner, but there has scarcely been an important meeting of operating officials within the past few months at which this subject, in some of its various phases, has not been discussed.

The movement is not alone confined to the railroads but is spreading throughout industrial concerns and devices are constantly been invented and applied to protect the employe from the operation of machinery, while at the same time, rules are being promulgated which in their application should greatly lessen the avoidable fatalities which have characterized railway operations for many years.

The safe way of doing a certain piece of work as compared with the unsafe way is being constantly emphasized and in this manner the men's attention is being sharply drawn to the foolhardy and unnecessary manner in which they perform some of their duties. For example, the latest issue of the "Safety Magazine" of the New York Central Lines, points out that one of the most frequent causes of accidents to railroad employes and one which often results in serious or fatal injury, is the practice of doing work between cars in an unsafe way. To quote from the magazine:

"Much has been said on this subject, but there

Digitized by Google



Two photographs illustrating the unsafe and safe way to conduct operations between cars. In the first photograph the cars are so close together that any backward movement of either would result disastrously.

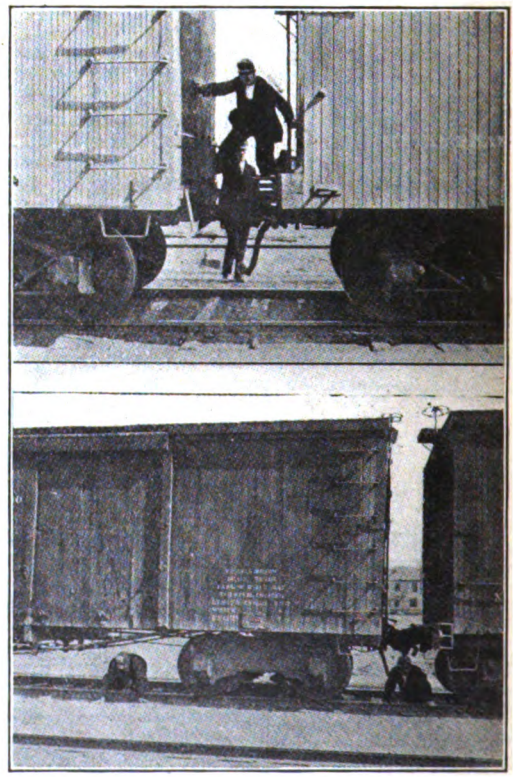
are still men who indulge in the practice, ignoring the advice that has been given, or else unthinkingly, carelessly, taking the chance. To those men who do this thing, thoughtlessly or otherwise, let these few words of warning awaken them to the seriousness of the risk they are taking. **Never go between moving cars for any purpose whatever.** If necessary to go between cars, stop them and **wait until they do stop.** If you don't someone may be reading your obituary before another week passes.

"In connection with this practice attention is particularly called to the pictures on the opposite page. There is also great risk involved where men attempt to do work between **standing cars that are too close together.** In the top picture, if the cars were to suddenly move from either direction, the man working there would be caught and seriously, if not fatally, hurt. He has left himself no chance to escape. The safer way is shown in the bottom picture where the cars are at least a car length apart and another member of the crew is standing by protecting the man between the cars. These are little measures of precaution that every employe should observe and do away with the chance of injury."

"Take the time to do it the safe way. It is the only way that is expected or required of you."

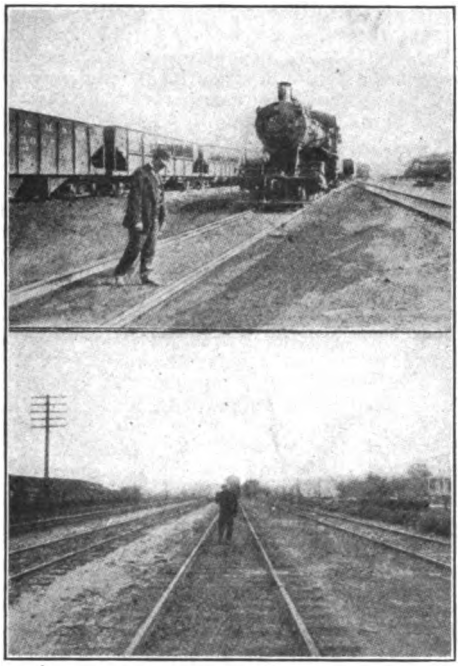
Trespassing on the railroads continues to occupy the attention of many operating officials and efforts are constantly being made to have effective laws passed or to instill into the minds of government officials the necessity for a more rigid enforcement of those laws already upon the statute books. The accompanying illustrations from the "Frisco Man" the official magazine of the Frisco Lines, speak for themselves and might be appropriately designated as gambling against eternity. These men are supposed to represent trespassers who, in crossing the tracks, often resort to the means illustrated. In order to save a few minutes' time in going from one side to the other they put themselves into a position to be instantly killed or lamed for life. It would appear that whether the person be a railroad employe or a trespasser and that no matter how important the duty of the other side of the track might be, is assuredly could not have been worth the risk taken.

One of the rather unusual developments in the safety movement has been the issuance of an order by the Illinois Central Railroad prohibiting employes engaged in operating trains, from affixing photographs to the faces or dials of watches, claiming that they distract the attention from their work which might cause accidents. Another point which has been taken up by the road in connection with the betterment of the time service, is a more rigid enforcement of the weekly comparison and efficiency tests to ascertain whether or not employes have in their possession all time weekly comparison cards. A permanent organization of the authorized local watch inspectors has ben effected and the question of establishing a uniform price for standard watch repairs is under consideration. No one but reliable watchmakers will be allowed to handle employes' watches.



The accompanying photographs show men who in desiring to cross the track, place themselves in grave danger of serious injury or death. An appropriate title for these pictures might be "Gambling Against Eternity."

Digitized by Google



In the upper photograph a man is shown crossing the track in an inattentive manner. In the second, a man is shown walking with the current of traffic—an extremely unsafe practice.

The current issue of the "Employes' Magazine" of the Buffalo, Rochester and Pittsburgh Railway, contains several interesting photographs showing dangerous methods of operating and loading trains. The two herewith presented, show an overload on an engine tender and a dangerous method of loading lumber on flat cars. In the latter connection, it is pointed out that two trainmen were recently killed on one road as the result of this kind of loading.

In connection with the safety movement a rather unusual honor has been paid the Pennsylvania Railroad by a foreign government. This company has been awarded a bronze medal for its exhibit of devices for accident prevention and safety guards in general at the Exposition of Hygiene at Saxon, Germany. At the close of the Exposition, which was visited by 6,000,000 people, the managers requested the Pennsylvania's exhibit for the Museum of Safety at Berlin. This was the first non-Germanic exhibit to be placed among the permanent collections of the Berlin Museum, which is an imperial institution.

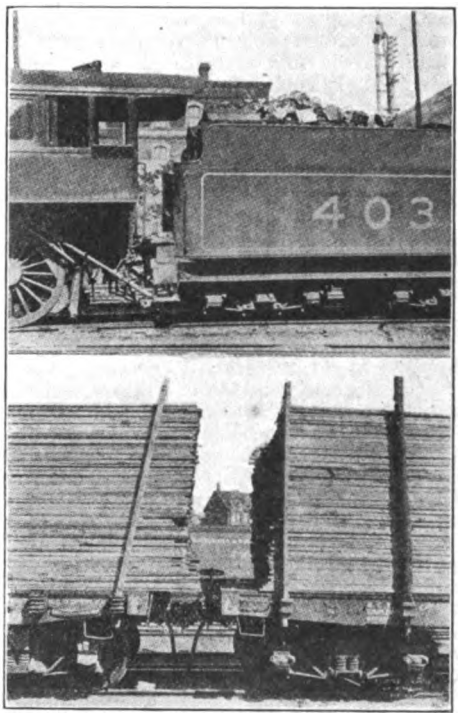
Direct appeal is being made by the Baltimore and Ohio Railroad to trespassers to refrain from walking on the tracks, under a plan which has been adopted by the maintenance of way forces in furtherance of a campaign to reduce the number of deaths and injuries to persons who have no business on or near railroad property.

When a trackwalker patroling the railroad in the interest of safety to the traveling public, or a section foreman, foreman of a track gang or one of his workmen meets a person tramping along the tracks, whether he be a confirmed hobo or mill employe, it is the duty of the railroad man to point out the danger which lurks behind this careless practice. And this appeal to the intelligence of the transgressor is backed up by information as to the number of lives that are sacrificed and the permanent injuries that occur each year as a result of people using the railroad right of way as a public highway.

This method of calling attention to the danger of trespassing on railroad property was inaugurated under the "Safety First" policy of the Baltimore and Ohio management. For some time past the company has waged a vigilant warfare against trespassing, through the officers of its police department; who are instructed to make arrest and the campaign has also been extended to an education of school children and other members of communities, but heretofore there has been no plan for coming in contact with the actual violators of the rules against trespassing.

The maintenance of way department has a representative on the safety committees of the company, and through these officials the men at work on the tracks are informed concerning accident statistics. Already there has been an appreciable reduction in the number of deaths and serious injuries, the Claims Department of the road attributing this in large measure to the efforts of the track forces in calling attention to the dangerous practice.

The Southern Pacific in its safety efforts on the Pacific Coast, points out that within the past twenty months in California there have been on country roads twenty-six lives lost and thirty-two persons injured in accidents at railroad crossings that could have been avoided had the drivers used due caution. This statement is made by railroad companies after getting stat-



Two examples of unsafe loading. An engine overloaded with coal and lumber stacked over the ends of flat cars. Two trainmen were recently killed on account of a loading of this character.

LACK OF INSPECTION OF PLANK CAUSED THIS ACCIDENT.

istics from special observers and from citizens in the communities who were serving on boards of inquiry.

The figures exclude city streets, where rush of traffic and noise may have been contributing factors. Neither do they include cases where persons were "joy-riding" or the drivers intoxicated.

The railroad companies are calling upon automobile men and others to help in accident prevention. On this subject, the Chicago "Tribune" in an editorial, recently said:

"When pedestrians are about to cross a city street, they ought to halt, look both ways, and when sure the road is clear, go ahead. When they fail to do this and get run over, automobilists say: 'Why did they not look before they left the sidewalk? We blew our horns. Why did they not take notice?'

"Cannot railroad officials say with some justice when trains hit automobiles, 'Why did not they look right and left before making the crossings? Our whistles blew; why did they not listen? When a street car comes by a grade crossing the conductor looks to see that all is clear. why not automobiles?

"A train does not come on one with the stealthy approach of an auto.

"Automobile Clubs might well advise their members—to do at railroad crossing what they say pedestrians should do at all street crossings —avoid 'contributory negligence.'"

Watchmen stationed by the Southern Pacific Company at crossings in San Francisco, found that seventy per cent, by actual count, of all auto drivers at crossings with railroads fail to look to right or left. Similarly in Stockton, out of 4,080 pedestrians only sixty looked up and down the tracks before crossing.

An official circular just issued by Mr. Howard G. Kelley, vice-president of the Grand Trunk Railway System, shows the earnest manner in which that system is endeavoring to prevent personal injuries to patrons and employes.

This circular is the result of an exhaustive study of the personal injury problem on the Grand Trunk by Mr. George Bradshaw, an expert Safety Engineer, who was engaged some time ago to study conditions and inaugurate the "Safety First Movement."

Safety committees composed of the local officers and one or more employes from each branch of the service, are organized on each operating division and in the principal shops and terminals, there being about 500 members of such committees. These local committees are directed to meet at least once a month, employes being allowed their necessary expenses and compensation for any time taken from their regular duties on account of committee work.

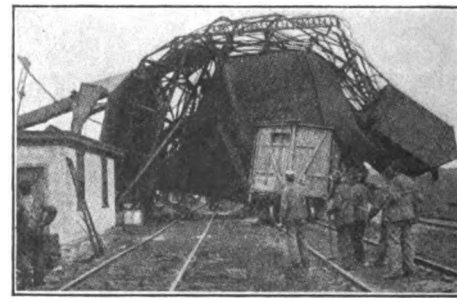
The purposes of the safety organization as stated by Mr. Kelley are: the correction of unsafe conditions and practices before an injury has resulted, and the investigation of accidents which may occur with a view to discovering the causes thereof and applying corrective measures, where possible, to prevent a recurrence.

It will be the duty of members of safety committees as they go about their regular work, to note unsafe conditions. Most railroad accidents are caused, not by collisions, derailments and wrecks, but by conditions and practices of an unsafe nature, which can to a great extent be overcome by thinking about prevention before instead of after an accident has happened.

A Steel Coal Chute Wreck on the Wabash.

AN unusual wreck occurred on the Wabash Railroad at Fort Wayne, Ind., on November 22nd, in which a steel coal chute was practically demolished. It happened in the following manner: A train while pulling off from a lead track under the chute, derailed a steel box car at the switch which was about fifty feet from the chute. As the train was not stopped instantly, this car sprung far enough from the rails to strike the chute with the results shown in the accompanying photograph.

An investigation showed that the track at the point of the accident was about three-quarters of an inch too wide and that there was no elevation of rail on the curve. A fact which doubtless contributed to the derailment, was that the side bearings of the car causing the mischief were, upon examination, found locked sideways and evidently had been so for some time.



From the *Railway and Engineering Review.*

A PECULIAR WRECK AT FORT WAYNE, IND., CAUSED BY DERAILMENT OF BOX CAR.

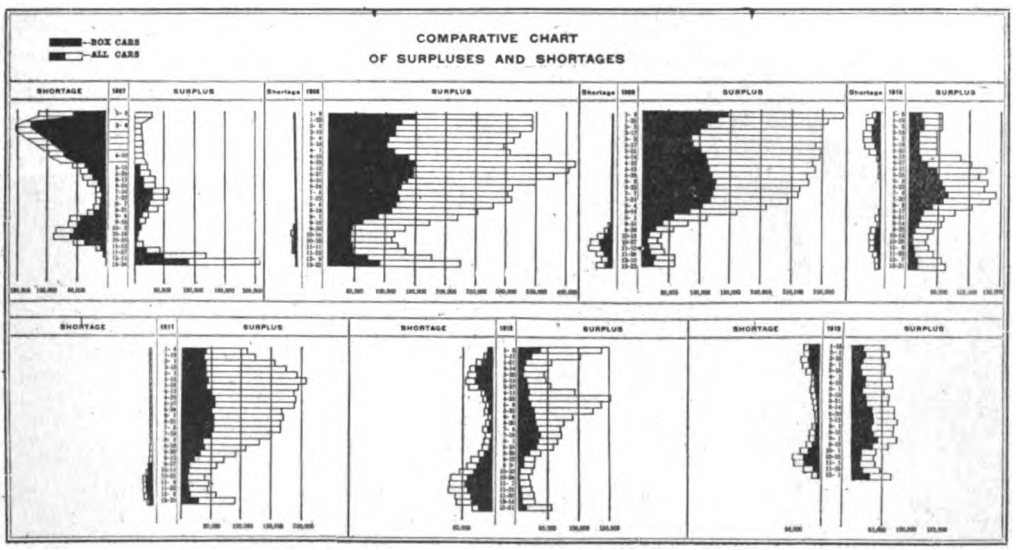
The Car Situation.

THE latest report of the American Railway Association shows that on November 15th, there was a total car surplus of 46,059 compared with 38,276 on November 1st, and 19,897 on November 7, 1912. The shortages for the same dates were 23,407 cars on November

Digitized by Google

15th, 40,118 on November 1st and 71,156 on November 7, 1912. In other words, the net surplus on November 15th of the present year was approximately 23,000 cars as compared with the net shortage on November 7, 1912, of over 50,000 cars. This difference is large enough to be unusually significant and indicates a serious falling off in freight movement as compared with last year.

The following diagram presents a record of the monthly surpluses and shortages for a period of seven years:



A Record Trip from Washington to New York.

THE recent Sayre-Wilson wedding at Washington was responsible for a record railway trip between that city and New York. A special train over the Baltimore and Ohio Railroad on the night of the wedding carried the photographs of the wedding party to certain New York newspapers and in so doing, shattered every time record made heretofore between these two points.

The combined efforts of the newspaper men and railroad officials made such results possible, which briefly stated, were that four hours to the second after the train left the Washington Union Station it was standing in the Jersey City Station, having consumed three hours, forty-eight and one-half minutes in actual running time, the quickest time ever made between the two points; and exactly four hours and forty-five minutes after the shutter of the camera closed in the White House, the photographic results were on the presses in "The American's" composing rooms in New York.

Outside the White House an automobile waited for the newspaper photographers who as soon as they entered it started the preliminary work of developing the plates, finishing the job in a studio, specially arranged, before they left for New York; so that when the special train pulled out the enlargements of at least a dozen photographs of the wedding party were spread out to dry during the four-hour run.

Meantime the railroad officials arranged for the special train, and no plans were ever worked out with more exactness or in greater detail. A schedule taking into account every second was hurriedly prepared.

Four minutes from the time the train left the Washington station the special was making sixty miles an hour. In the next minute it was making a 65-mile gait and was kept on this schedule to Baltimore, which was reached at 8.45. The train slowed down to thirty miles an hour through the Baltimore terminals.

The train reached Philadelphia at 10.25 covering the distance from Washington to that city of 138 miles in 135 minutes. The run from Philadelphia to Jersey City was equally as fast and with the exception of the slowdowns which were made necessary by passing through the larger cities, the running time between Washington and New York approximated 65 miles an hour.

A Suggested Plan for Joint Car Ownership.

NEWMAN ERB, president of the Minneapolis & St. Louis, the Ann Arbor and the Denver & Salt Lake railroads, has issued a statement of a plan of freight car ownership, which he has devised, and which he believes would solve many of the problems that now arise in car distribution. Mr. Erb proposes a federation, or association, into which the railroads of the United States would contribute a certain amount of cash each year, the money to be used for buying cars for interstate business. The amount to be paid by each line would be calculated on a ten-mile basis until about $25,000,000 has been raised. With $25,000,000 for a beginning, the purchase of $100,000,00 worth of cars would be negotiated, the federation to issue certificates for $75,000,000, behind which all the roads that were members would stand. Following the distribution of this equipment upon a tonnage basis, a road would be privileged upon an order of the federation, to deliver a certain number of Pennsylvania cars to the Michigan Central, for illustration, if the latter did not have

Digitized by Google

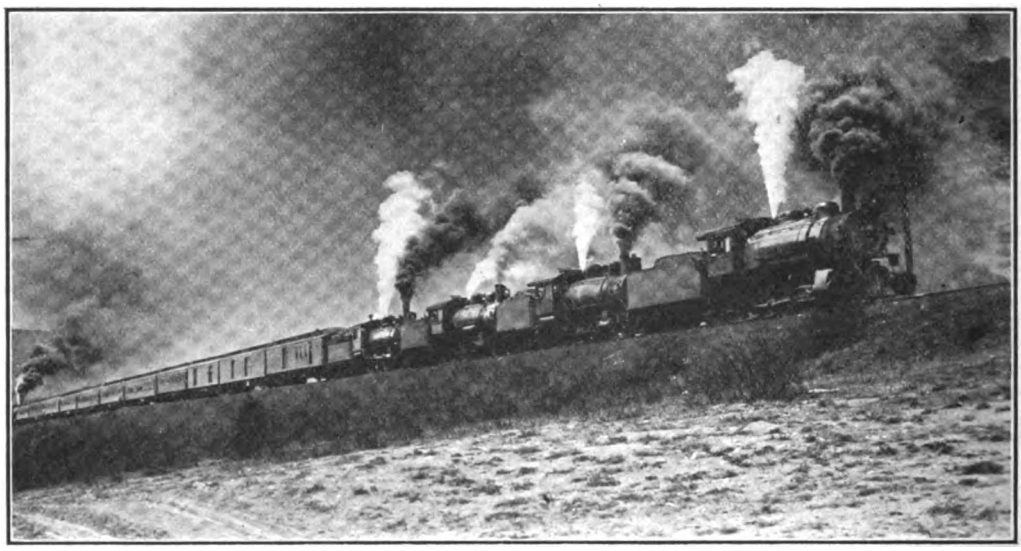
its full quota and was in actual need of them. The scheme does not propose a reduction or abandonment of the present per-diem penalty of 45 cents for the detention of foreign cars. On the contrary its continuance is required and the aggregate from this source, it is estimated, would be about $40,000 a day. This is to be used as a fund for gradually wiping out the equipment trust certificates, after the accomplishment of which there would remain a paid-up capital of $25,000,000 and the railroads would have cars worth $100,000,000 with which to carry on their interstate traffic.

Completion of Denver and Rio Grande Improvement Over Wasatch Mountains, Utah.

ATTENTION was called in the May issue of the RAILWAY WORLD to the important piece of reconstruction work being done by the Denver and Rio Grande Railway on the grade between Soldier Summit and Tucker, Utah. This new double track has now been put into operation and has replaced the old four per cent line with one of a two per cent maximum. The old four per cent grade was the heaviest on the main lien of the Denver and Rio Grande, so that the improvement greatly facilitates the movement of both passenger and freight trains.

Soldier Summit lies on the main line between Denver and Salt Lake City at the crossing of the Wasatch Mountains at an elevation of 4,445 feet. The new piece o froad has a 255-foot tunnel numerous concrete arches instead of bridges, and its length between Soldier Summit and Tucker is fifteen instead of seven miles long. It has permitted, however, a reduction of grade, as previously referred to of from four to two per cent, or 105½ feet to the mile.

What this means in train movement is shown by the accompanying photograph, illustrating a train ascending the four per cent grade with four engines pulling eleven cars and an additional engine acting as pusher. With the completion of the new line the six helper engines at Tucker with the necessary roundhouse and engine facilities and the station force, were eliminated as the one helper engine which is now put on at Thistle is able to



DENVER AND RIO GRANDE PASSENGER TRAIN CLIMBING FOUR PER CENT GRADE, SOLDIER SUMMIT, WASATCH MOUNTAINS, UTAH, BEFORE IMPROVEMENT, REQUIRING FIVE ENGINES.

Digitized by Google

assist a tonnage train to the Summit. The complete air testing plant with car repairers and inspectors at Soldier Summit will also be unnecessary as now only the regular tests of air are made before descending the grade. This eliminates a past average detention of one hour to all freight trains westbound which item alone is estimated as amounting to approximately $2.47 per train for the dead time of train and engine crews. A second picture is herewith included illustrating the manner in which the trains are now handled on the two per cent grade.

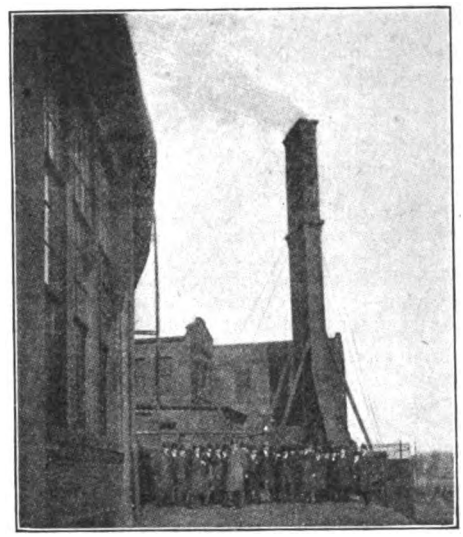
Successful Experiment in Smoke Washing.

THE "Age Gazette" presented an interesting account in its issue of November 28th, of an installation made by the Lake Shore and Michigan Southern, of a smoke washing system in the new thirty stall engine house at Englewood, Chicago. The illustration shows it in full operation, handling the smoke from twenty-two engines about ten of which had green fires.

The smoke from the engines discharges into Dickinson cast iron telescopic smoke jacks which fit over the stacks. A damper is provided in each jack which provides a means for regulating the draught on the engine while in the engine house and also allows the draught to be shut entirely off when it is not desired to use the jack. The draught is obtained by a special 78-inch steel plate fan.

The smoke duct, supported on the roof timbers of the engine house, is of circular section, made of asbestos board and discharges into a 48-inch pipe that leads to the fan. The smoke duct on the discharge side of the fan delivers the smoke to three smaller ducts that lead to separate compartments in the washing tank. As the tank ends of these ducts deliver below the water level, the water backs up some ten or fifteen feet in the ducts. A steam jet is placed in each duct to agitate the water so that the smoke and the water will be thoroughly mixed.

This mixture passes into the tank compartments and the free gases are caught in chambers from which they are forced back into the water as the pressure builds up and are finally liberated, after the solid matter has been completely taken out by the water, to a wooden stack 65 feet high.



THE SMOKE WASHING PLANT OF THE LAKE SHORE RAILROAD AT ENGLEWOOD, ILL.

The residue left from this washing process is made up of the following constituents:

Carbon	82.6 per cent
Sulphur	2.6 per cent
Moisture	3.9 per cent
Iron Oxide	8.7 per cent
Silica	1.8 per cent
Calcium and Magnesium Oxides	0.4 per cent

This residue will float on the water and is removed each day, about ten barrels per day being obtained when the plant works at its average capacity, which is about 95 engines. All parts coming in contact with the water, which contains a large amount of sulphurous acid, are painted with a tar paint.

TRAIN ACCIDENTS IN OCTOBER.

The following list constitutes a record of the more important train accidents that occurred on the United States railways during the month of October:

COLLISIONS.

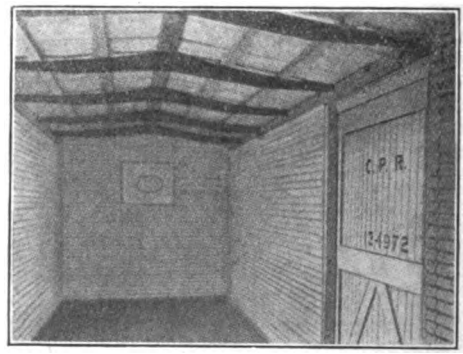
Mechanical

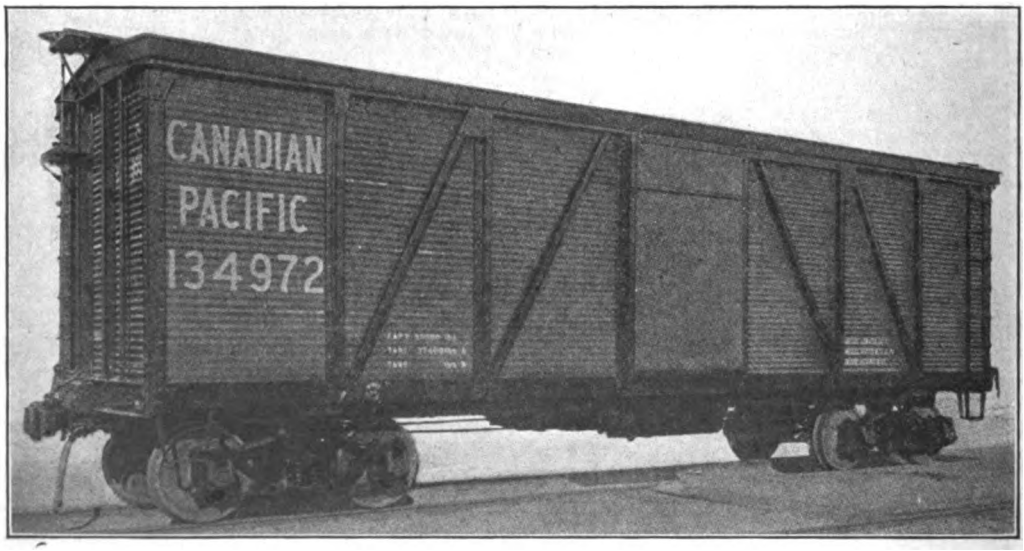
Inside Sheathed Steel Frame Box Cars.

AT the annual meeting of the American Society of Mechanical Engineers, held on December 3, R. W. Burnett, general car builder of the Canadian Pacific Railway, read an interesting paper on inside sheathed steel frame box cars. The author stated that the Canadian Pacific designed its first box car of this character in 1908. This car avoided the disadvantage of the outside sheathed car, obtained a further reduction in weight and provided for cheapness of maintenance by the use of steel superstructure without the additional lumber required by the outside sheathed car. With practically no preliminary experimenting 500 of these cars were built and since then over 30,000 have been built similar to the first cars, with the exception of certain refinements of detail which have tended to reduce weight and simplify construction.

Mr. Burnett holds that the steel frame inside sheathed car has several advantages over the types previously used, notably in that the tare is low in proportion to the capacity. The weight is from 1,000 to 5,000 pounds less than other cars and in addition to less dead weight to haul when the car is empty or partly loaded, it permits of a heavier loading of the car.



INTERIOR VIEW OF CANADIAN PACIFIC'S STEEL FRAME BOX CAR WITH CORRUGATED METAL SHEATHING.



CANADIAN PACIFIC'S CORRUGATED STEEL FRAME BOX CAR.

Digitized by Google

Referring to the employment of corrugated steel lining in the construction of cars of this character, Mr. Burnett stated that in the summer of 1911 the Canadian Pacific lined a steel frame box car with corrugated steel and found it to be as simple a matter as lining with wood. After eighteen months of general service, this car was brought in and on examination found to be in as good shape as when constructed, the paint sealing the joints where the side sheets lapped was in no place broken, indicating that there was no material weaving or deflection of the sides.

A Notable Consignment of Cars for the Grand Trunk.

THE Grand Trunk Railway system has recently added to their equipment, a large number of steel cars of improved design, including several thousand all steel hopper cars, two thousand frame box cars and two hundred and fifty steel underframe automobile cars. Illustrations of the box and automobile cars are herewith presented.

The two thousand box cars which as indicated, are of steel frame construction and have a capacity of 60,000 pounds each were manufactured by the Pressed Steel Car Company at their McKees Rocks works. These cars have steel under and upper frames and carlines with wooden floor, roof and sheathing. The body bolsters are built integral with underframe and are made of four pressed steel diaphragms and one cast center brace reinforced at top and bottom with cover plates. The underframe is further strengthened, transversely, by two cross bearers made of pressed steel diaphragms. The cars are equipped with Westinghouse air brakes, cast steel couplers, vertical twin spring draught gear with key attachment to couplers, roller side bearings, inside metal roof and all safety appliances in accordance with Interstate Commerce Commission's requirements.

The sixty-pound capacity automobile cars which were built for this company by the Western Steel Car and Foundry Company at its Illinois plant, have a steel underframe of the structural type composed of plates and shapes except for the bolster and cross bearer diaphragms which are pressed steel. The superstructure is of a wooden type with diagonol tie rods in the side and each side is fitted with double side doors set off center and one end fitted with double hinge and doors

TWO STRIKING EXAMPLES OF MODERN FREIGHT CAR EQUIPMENT. PART OF AN ORDER OF 2,000 BOX CARS RECENTLY PURCHASED BY THE GRAND TRUNK RAILWAY.

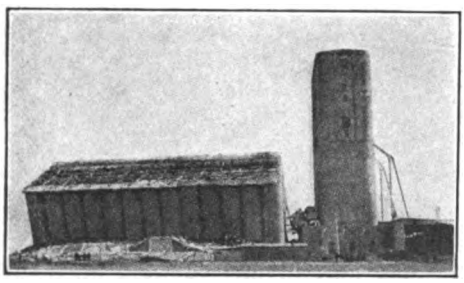
with a vertical operated locking device. The roof is of the inside metal type and the car is braced longitudinally by diagonal braces fitted into the side plates and carlines near the center of the car.

Foundation Failure of Canadian Pacific's Grain Elevator.

THE Canadian Pacific's new grain elevator at Transcona, Canada, met with an unusual foundation failure recently, due to the crushing of the material under one side of the structure permitting it to settle as indicated in the photograph. This occurred on October 18th, when the elevator was practically full. A sliding movement was noticed about eleven o'clock in the morning and by one o'clock in the afternoon the bin house had settled about one foot and the ground for a distance of about thirty feet on three sides of the bin house, had risen from four to five feet. The building continued slowly to settle until noon of the following day when the angle reached was 28 degrees from the vertical, the base at the east end of the structure being about five feet above the former level, while the base at the west end was about thirty feet below the surface. It is stated that the use of the elevator cannot be resumed until the bins have been reconstructed or moved back in their normal position. A remarkable feature of the accident is that the headhouse remained undamaged.



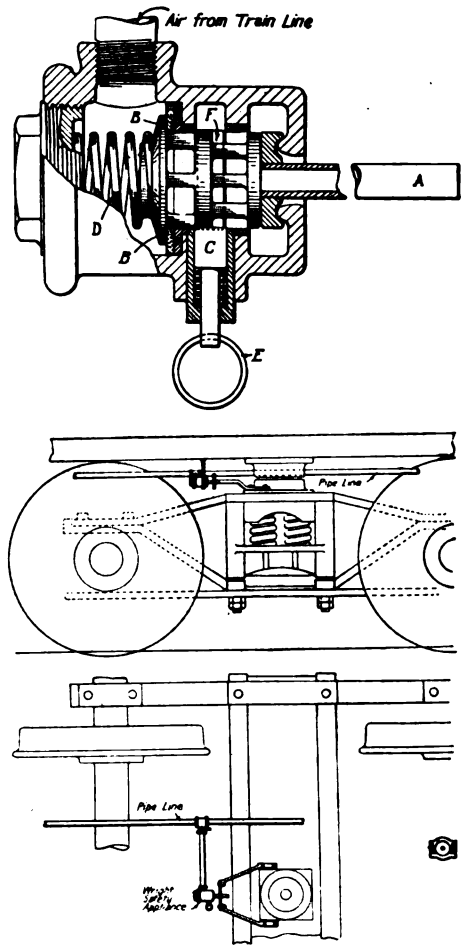
CANADIAN PACIFIC'S GRAIN ELEVATOR AT TRANSCONA, AFTER FAILURE OF FOUNDATION.

A New Safety Air-Brake Appliance.

A NEW automatic train stop designed to operate under conditions in which there results an abnormal movement of the trucks with relation to the car body, has been perfected and put on the market by the Wright Safety Air Brake Appliance Company, of Greensboro, N. C.

A device of this character is meant to be of service in setting the brakes in case of any of the various defects to trucks or track construction involving the derailment of one or more pairs of wheels. These include broken or spreading rails, obstructions on the track such as dropped brake shoes or beams, broken wheels, flanges or axles and any other forms of truck derangement which may tend to the derailment of the wheels and thereby cause the wreck of one or several cars.

The accompanying illustration shows the device in detail as well as its method of application. In effect, it is simply a release valve so



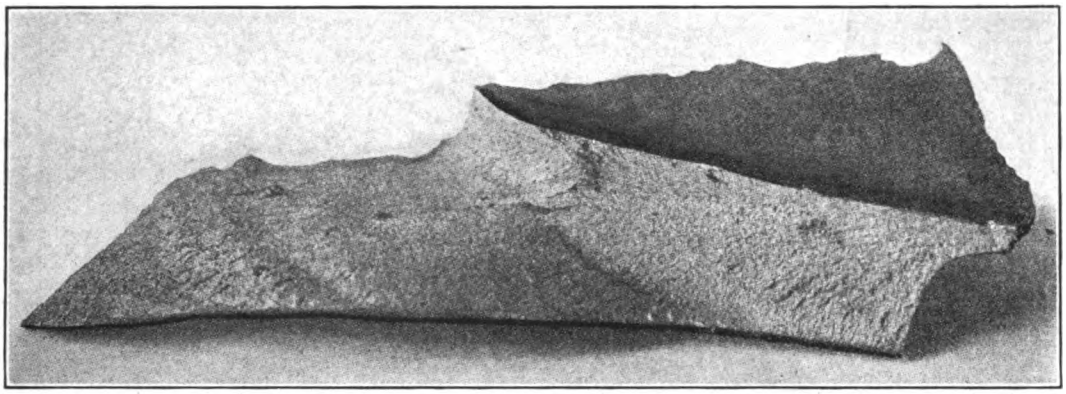
METHOD OF APPLICATION OF THE WRIGHT SAFETY AIR BRAKE APPARATUS.

that a reasonable movement of its protruding stem A unsets the valve at BB allowing the air to escape from the train line and thus applying the brakes. When the disc has been removed from the valve set at a sufficient distance, the latch C springs into place, holding the valve in the open position which is important in case either the stem or its operating yoke becomes broken through excessive dislocation of the truck. The interference with the stem being removed, the valve assumes its closed position on pulling out the latch C for which purpose the ring E is provided.

A Remarkable Test of Chrome Vanadium Wheels.

THE Standard Steel Works Company has recently completed part of an order for four hundred heat-treated chrome vanadium steel rolled wheels to be placed by the Grand Trunk Railway on the tenders of fifty Mikado locomotives having a capacity for 9,000 gallons of water and fifteen tons of coal and a weight under full load of 172,000 pounds. This gives

Digitized by Google



From the *Railway and Engineering Review.*

A FRAGMENT OF BROKEN CHROME VANADIUM STEEL, SHOWING TOUGH FIBROUS STRUCTURE OF THE METAL.

an average load per wheel on rail of 21,500 pounds.

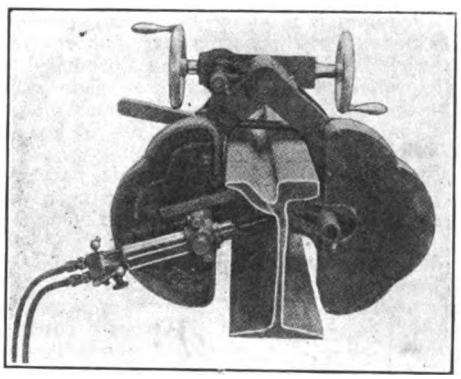
In order to most thoroughly determine the strength and toughness of this type of wheel, severe drop tests in addition to the usual physical tests and chemcal analyses were made of wheels selected at random. As these are the first tests of this character ever made of wheels of this kind, the results are of especial interest as data for record.

The wheels were made from two fifty-ton heats of acid open hearth steel. One wheel from each heat was tested, and the results were found to be remarkably uniform. It was the original intention to test three wheels under the drop; one in running position, one with the concave side of the plate upward and one with the convex side of plate upward. In the first test the wheel made from heat 9686 was drop tested in a horizontal position and to the point of destruction. In this test, though twice reversed, the wheel withstood a total of 1,254,000 foot-pounds before cracking or breaking. It was first placed under the drop with the concave or dished face of the plate up, in which position it offers least resistance to a blow or thrust. In this position it withstood without fracture or even deflection, the following blows from a 2240-pound tup dropping on the face of the hub and equivalent to a total of 515,200 foot-pounds of energy; one blow each at 5, 10, 15 and 20 feet, and six blows at 30 feet. It was then reversed, with the convex side up, or in the position of its greatest resistance to side thrust. In this position it was subjected without failure to ten blows from a height of 30 feet, equivalent to 672,000 foot-pounds. Following this the wheel was again reversed to its original position and given one blow at 30 feet, at which it finally broke in four pieces. The illustration of one of the broken pieces shows the tough, fibrous structure of the metal.

Cutting Rails by Oxy-Acetylene Method.

THE Davis-Bournonville Company, New York, has recently developed the oxy-acetylene rail-cutting machine shown in the accompanying illustration and known as the "railagraph." It can be used on a rail in position in the roadbed. The machine consists of a stand which is clamped on to the rail, and on each side of the rail a bracket is provided in which the cutting torch can be mounted. This bracket is secured to a slide which is moved by a roller held in contact with a cam by a tension spring. Different forms of cams are provided for cutting different styles of rails.

The machine is driven by the small hand-wheels at the top and as these are rotated the torch is made to travel over the rail, the cam and slide arrangement holding the end of the torch about 1/8 inch from the work. In operation, the torch is first applied at one side of the rail and fed over the line on which it is to be cut, one half



DEVICE EMPLOYED FOR CUTTING RAILS.

of the base, the entire web and one half of the rail surface being cut by this operation. The torch is next removed from the holder, and mounted at the opposite of the rail, it is passed over the work a second time in order to cut the remaining halves of the base and rail surface. During a recent exhibition a 9-inch girder rail was cut off in three minutes, with a consumption of two cubic feet of acetylene and 5½ cubic feet of oxygen. A comparison between this time and the time required to cut off such a rail with a hand hacksaw will readily show the desirability of using the equipment for work of this kind. The standard Davis-Bournonville machine cutting torch is used on this machine, except that for rail cutting the torch is made about two inches shorter than the standard dimension. Oxygen is used at a pressure of 50 pounds per square inch.

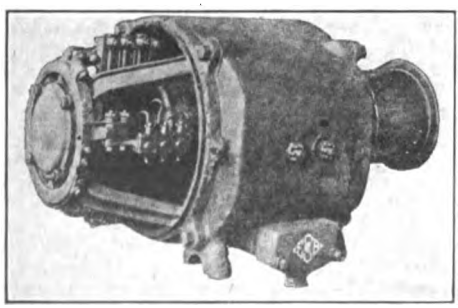
CONSTANT VOLTAGE AXLE LIGHTING EQUIPMENT ARRANGED FOR DEMONSTRATION PURPOSES.

A New Axle-Lighting System.

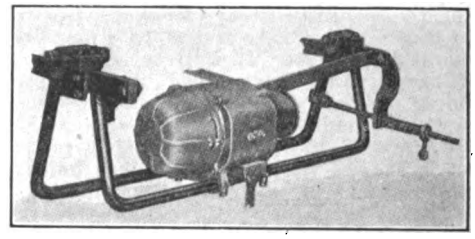
A NEW axle-lighting system to be used in connection with the electric lighting of railway trains has been put on the market by the Electric Storage Battery Company of Philadelphia. In many respects this system constitutes a radical departure from previous practice. The dynamo mounted in the usual method is of the Rosenburg type which has been extensively used abroad for this purpose. The main field excitation is produced by armature reaction due to current flow between a pair of short-circuited brushes. This flow of current is produced by a small primary field excitation at right angles to the main field excitation. The constant voltage characteristic of the machine is obtained by connecting the primary field winding across opposite corners of a Wheatstone bridge; the other two junction points of the bridge being connected across the main terminals of the machine. The bridge is composed of fixed resistance in two diagonally opposite branches and in the other two branches resistance of high temperature coefficient, such as the so-called iron wire "ballasts." It is claimed that this system eliminates practically all of the automatic apparatus found in other axle systems.

When the car is standing there is no discharge whatever from the battery for the excitation of so-called teaser coils, or for any other purpose, provided the lights are turned off. The equipment can, therefore, stand for many weeks without the battery losing its charge and can, therefore be put into service immediately after such a period of idleness without further attention.

The first of these equipments to be put into actual service was installed on a car of one of the Western trunk lines in November, 1912, and has been in continuous service ever since. As a result of the operation of this equipment the railway in question has ordered 62 equipments of this type which are now about to be put into service. During the year of operation the equipment, it is asserted, has shown the following remarkable performance: No light failure; no delay to car service on account of axle lighting equipment; no repairs to dynamo (except replacing of a defective ball bearing, these bearings being smaller than present standard); no removal of dynamo from car; no charging of battery, except that given by axle-dynamo en route; no change in adjustment of controlling apparatus.



THE DYNAMO OF THE ELECTRIC STORAGE BATTERY COMPANY'S NEW AXLE LIGHTING SYSTEM.

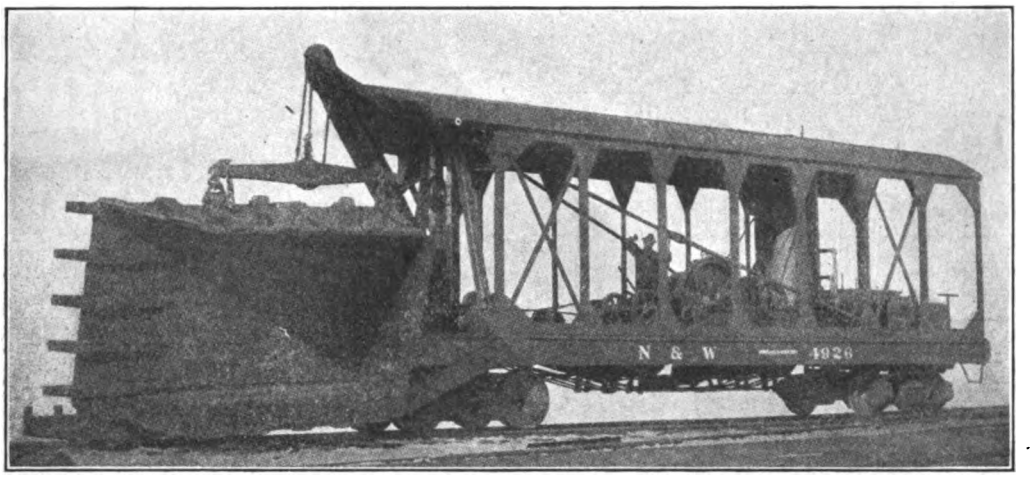


METHOD OF INSTALLATION.

A New Scoop Car for the Norfolk and Western.

THE Norfolk and Western has recently designed and built a scoop car to be employed in removing earth and rocks which, as the result of slides, often block the right of way. As the accompanying illustration shows, the car is, in effect, a wooden flat car having a heavy wooden roof supported on steel frame work. The scoop which is of ten cubic yards capacity, is handled by a twenty-five- ton revolving jib crane

Digitized by Google

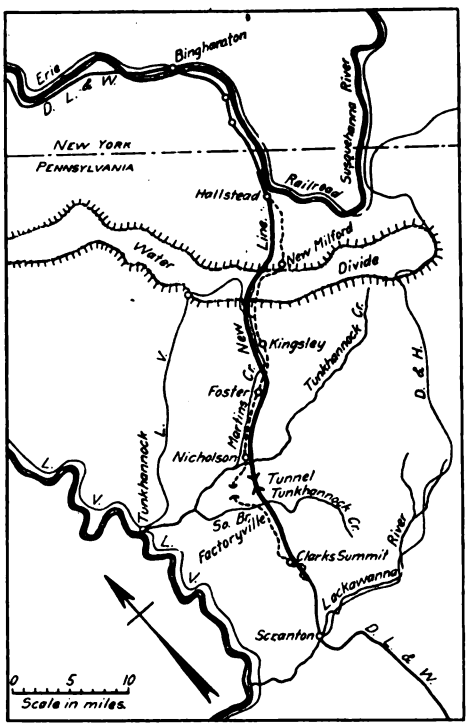


A New Scoop Car Recently Designed and Built by the Norfolk and Western Railway.

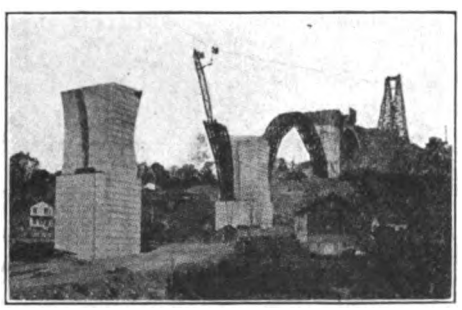
mounted on the forward end of the car. The engine is of the Lidgerwood hoisting type being especially designed for this purpose and having a lifting capacity of 17,000 pounds at a speed of thirty feet per minute. A single locomotive is employed in driving the scoop into the bank of material, the speed, when striking, being from six to ten miles per hour. This usually fills the scoop about three fourths full, permitting the removal of about seven cubic yards of material at each impact. In train service or in carrying the scoop a long distance, it, and the cradle, are fastened together and the entire outfit raised by the crane and loaded on an adjacent flat car and the two cars then coupled together.

The Largest Concrete Arch Bridge in the World.

THE Delaware, Lackawanna and Western Railroad is building a cut-off between Clarks Summit, Pa., and Hallstead, by replacing 40 miles of line between these points at an approximate cost of $12,000,000. The most notable feature of this work is the bridge construction which includes two concrete viaducts, one over Tunkhannock Creek and the other over Martins Creek, the former requiring about 167,000 yards of concrete and the latter 78,000. Minor structures of this character which number about eighty, will require 155,000 yards.

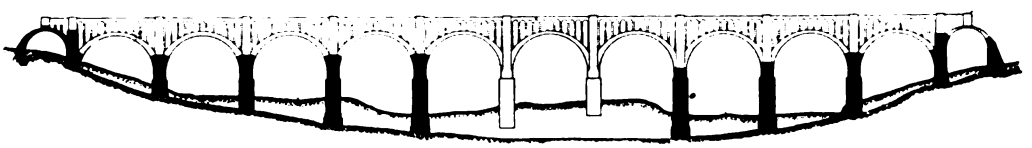


Location of New Cut-Off Between Clark's Summit and Hallstead.



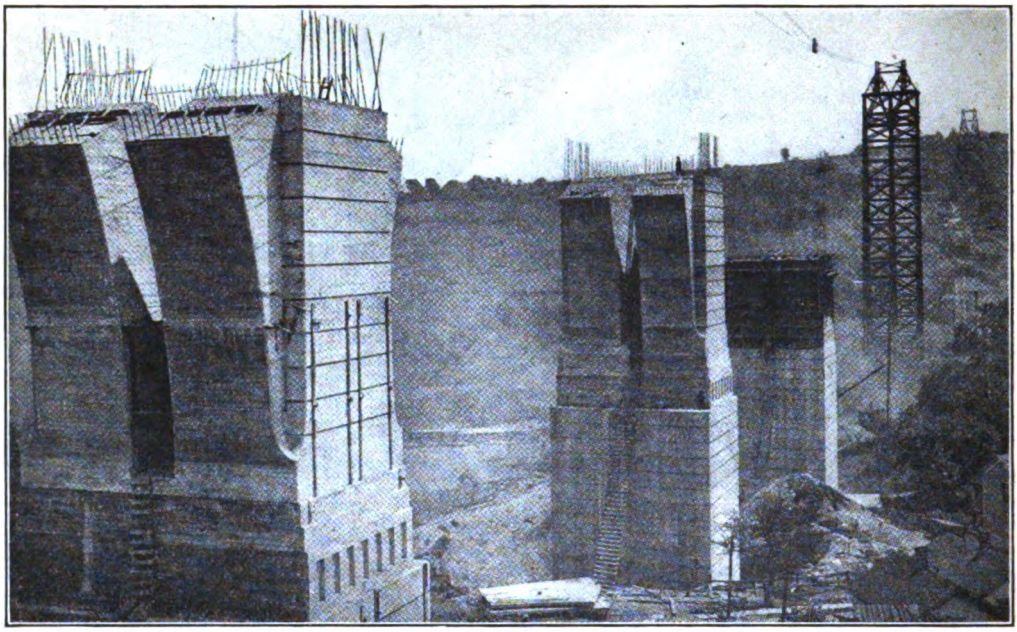
First Sections of False Work Trusses.

The viaduct over Tunkhannock Creek will represent, when completed, the largest concrete arch bridge in the world. It will be 300 feet high from parapet to foundation and will have a length



Shaded Portions Indicate Completed Portions.

Digitized by Google

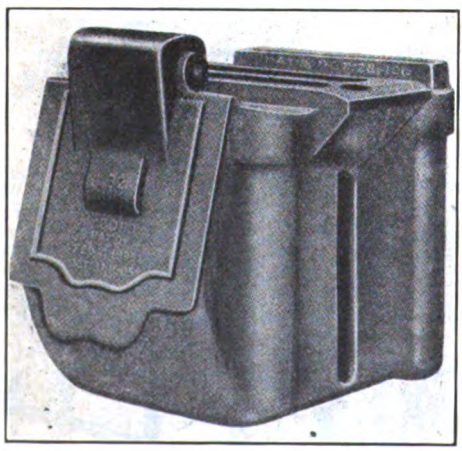


TWO OF THE VIADUCT PIERS WITH UMBRELLA SECTIONS COMPLETE.

of 2,230 feet. It will consist of twelve arches, ten of 180 feet span and two of 100 feet span. The abutment spans will be buried in the end embankments so that they will not be apparent after the work is completed. Besides the 167,000 cubic yards of concrete employed, there will also be used 2,275,000 pounds of reinforced steel. In building the foundation, the excavation of 43,500 cubic yards of material will be required. These excavations have been carried in open cofferdams through sand, gravel and boulder to a depth of sixty feet below ground water level. The accompanying illustrations give some idea of the progress of the magnitude of this work.

A New Combination Pressed Steel Journal Box. Utilizing Railway Scrap.

McCHORD AND COMPANY have recently brought out a new combination pressed steel and cast steel journal box. In its construction, the pressed steel collar and the cast steel top are made integral without the use of rivets or any other attachments that would be loosened by vibration and service. The accompanying illustration gives an excellent idea of the construction.



COMBINATION PRESSED STEEL AND CAST STEEL JOURNAL BOX.

Utilizing Railway Scrap.

SO successful have been the efforts of the Southern Pacific Company in reclaiming waste material and making it over into useful forms that a speical expert on this subject has been sent East to study the way the problem is handled on other lines. Edmund Burke, chief clerk under I. O. Rhoades, general purchasing agent, left to confer with officials of the railroads radiating from Chicago, St. Louis, Kansas City, St. Paul and New Orleans. He will be gone several months and will have nothing to do but learn the latest progress in his work throughout the United States.

The purchasing and stores departments of the Southern Pacific are already saving thousands of dollars a month by using up what was once discarded as old junk. A few months ago, an nouncement was made of the recovery of twelve thousand dollars each year through the use of old locomotive boiler tubes. Since then it has been found that even the soot deposited in the flues of oil-burning engines is valuable. It is pure carbon and has replaced coke in many blacksmithshops. Section men have been instructed to gather up all the old nuts and bolts that fall from trains along the right-of-way. These are sent to the shops at Sacramento, Los Angeles or Portland where they are re-threaded and machined and made as good as ever. Electric welding machines have been put in with which castings of steel that have become cracked can be welded together again and be even stronger than before. And the supply trains now pick up all old and discarded material before giving out the new, use being found for practically everything.

Electric Locomotives in Freight Service.

THE plant of the Chase Rolling Mill Company, Waterbury, Conn., is located about 1½ miles from the nearest railroad track and at an elevation considerably above the railroad. Heretofore all the hauling, raw material and finished product, to and from the station has been handled by eight-horse teams. This proved to be expensive, costing at least 50 cents a ton.

To replace these teams an electric line 2.3 miles length, with a maximum grade of five per cent was built from the railroad to the mill. Two Baldwin-Westinghouse 45-ton electric locomotives were employed to handle the work formerly done with 20 eight-horse teams. Each locomotive is equipped with four Westinghouse No. 301-D-E, 100 horsepower, 600-volt motors and type HL control, and weighs 45 tons completely equipped.

The control equipment of these locomotives is mounted in the center of the locomotive and surrounded by an expanded metal screen cage. This centralization of equipment is one of the important features of Baldwin-Westinghouse locomotives.

One departure from the usual construction followed in locomotives is that the motors are "outside" instead of "inside" hung. This arrangement was necessary in order to give the trucks a short wheel base so as to enable them to easily negotiate the shap curves to be encountered.

The locomotives make from eight to ten trips per day and with a load of approximately from 100 to 125 tons each. This load is governed by the five per cent grade previously mentioned which is 3,000 feet in length.

These locomotives have been in operation since the first of the year and have had a perfect record, having given no trouble whatever.

The same engineer has the same locomotive every day and is responsible for its condition. These men are perfectly competent to make ordinary inspection and keep the apparatus cleaned and oiled. In addition to this, at stated periods of approximately one month the machines are thoroughly inspected by the men in the repair shop. Aside from this no other work has been done since the locomotives have been put in service, and not one cent has been spent on repairs.

Some of the characteristics of these locomotives are given below:

CAPACITY.

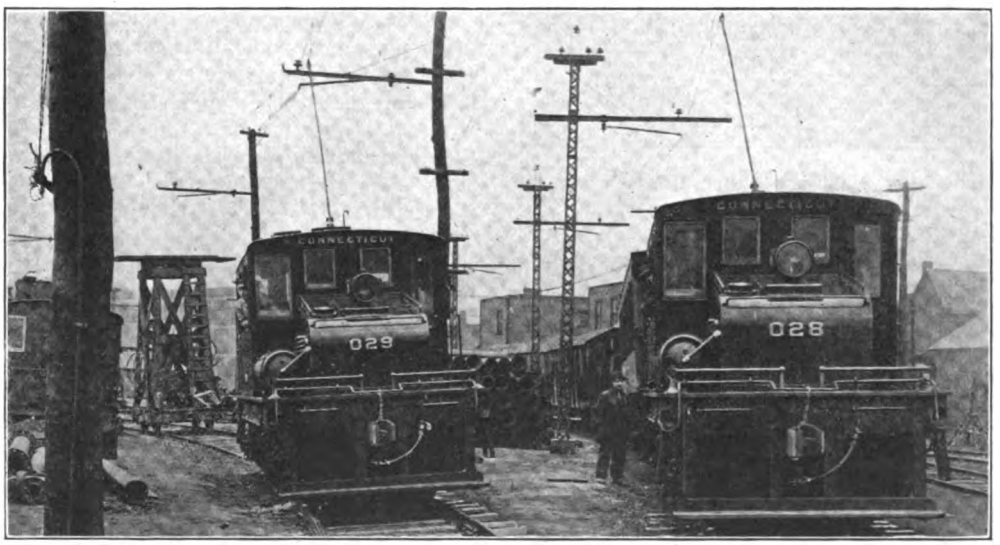
Continuous capacity—tractive effort with natural ventilation	4560 lbs.
Tractive effort at one hour rating, at 7.8 miles per hour at 600 volts	17270 lbs.
Maximum tractive effort	22500 lbs.

RATED HAULING CAPACITY.

Track profile.	Number of cars each weighing 45 tons with load.	Max. Speed M. P. H.
Straight level track	38	9.2
½ per cent grade	21	7.8
1 per cent grade	13	7.8
2 per cent grade	7	7.8

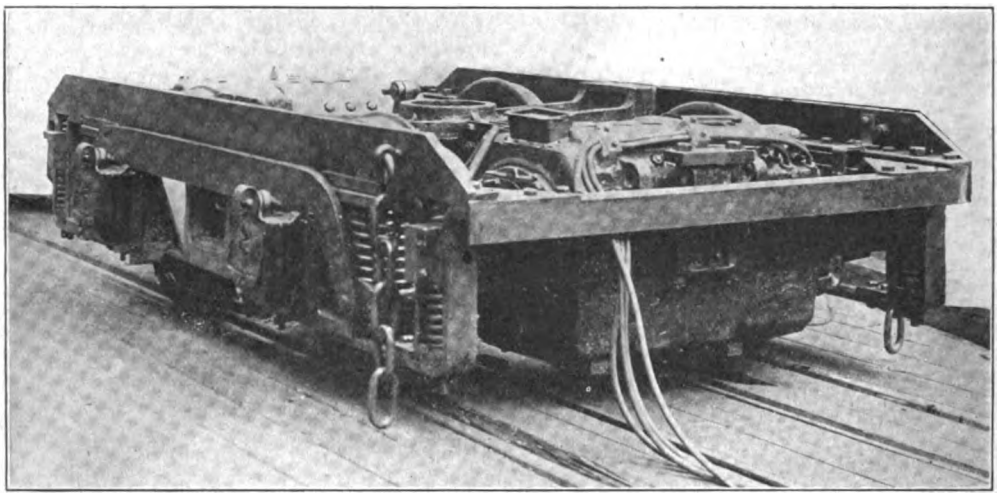
Main Line Electrification of the Chicago, Milwaukee and St. Paul.

THE *Electric World* states that the Chicago, Milwaukee and St. Paul Railway Company will probably before January first reach a decision as to the type of equipment to be employed for the extensive main-line electrification of its railroad over the mountains in Montana. It is practically certain that the overhead trolley system will be used to convey the electrical energy to the motors on the electric locomotives. Either the 14,000-volt, 25-cycle alternating current system will be used or the direct current 2400-volt system. Plans which have been submitted by the General Electric Company and the Westinghouse Electric and Manufacturing

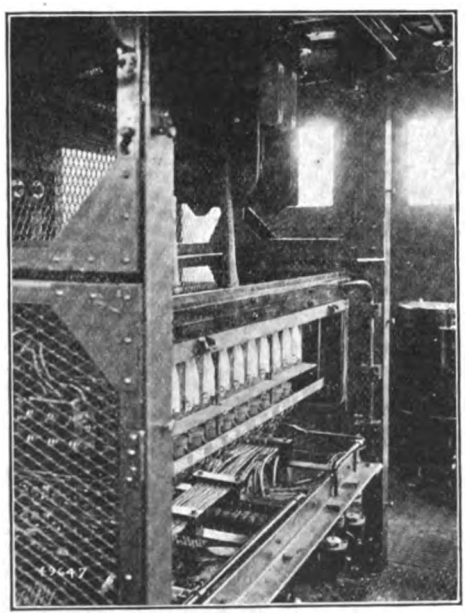


BALDWIN-WESTINGHOUSE ELECTRIC LOCOMOTIVES USED IN YARD SERVICE.

Digitized by Google



METHOD OF INSTALLING MOTORS WHICH ARE OUTSIDE HUNG IN SUCH A MANNER AS TO ALLOW A SHORT WHEEL BASE FOR TRAVERSING SHARP CURVES.



INTERIOR OF BALDWIN-WESTINGHOUSE ELECTRIC LOCOMOTIVE.

Company are now under consideration. For the railroad company the entire matter of electrification has been placed in the hands of Mr. C. A. Goodnow, vice-president in charge of operation and construction.

At first it is proposed to electrify a division of the railroad 113 miles long, extending over the Rocky Mountains between Three Forks and Deer Lodge, Mont. This work will be begun early in 1914. Ultimately the electrification will be extended to that portion of the main line between Harlowton, Mont., and Avery, Idaho, a main-line distance of 440 miles and, including sidings, a total of 450 miles of track. This work will mean an outlay on the part of the railroad company of perhaps $6,000,000 or $8,000,000, and the electrical construction work will proceed at such a rate that the annual expenditure will be about $1,500,000 or $2,000,000.

Experience with heavy railroad operation in and near New York City shows that electric locomotives can be run 2,000 miles without inspection under the conditions existing there. The locomotives which will be placed in service on the mountain divisions of the Chicago, Milwaukee and St. Paul can be relied upon to make from 250 to 300 miles at the outset. As there will be no delays for coaling, taking on water, cleaning fires or waiting for steam, it seems a fair conclusion that the tonnage will be handled with fewer locomotives, higher average speed and with a regularity which will result in better operating conditions. Passengers will be able to enjoy the mountain scenery without the annoyances incident to steam locomotion. Another point of interest is that while the steam locomotive is at its worst in freezing weather the electric locomotive is at its best at that time, since practically the only difficulty with the electric locomotive is to keep the motors from heating when doing maximum work.

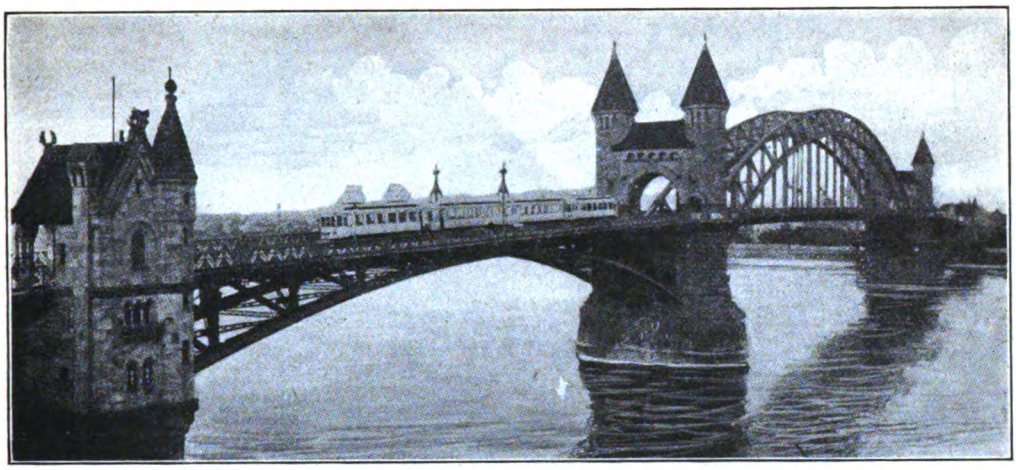
One of the important benefits to result from electrical operation is the regenerative control of trains descending mountain grades by means of which energy will be returned to the line.

Energy will be purchased from the Montana Power Company.

A High-Tension Direct-Current Railway.

THE *Electric Railway Journal* of November 1st, contains an interesting account of a high-tension direct-current German railway of 17.6 miles in length, which operates in the Rhine Valley between Cologne and Bonn. This road is noted as being the first railway on which

Digitized by Google



From the *Electric Railway Journal.*

SHOWING TRAIN OF RHINE INTERURBAN RAILWAY CROSSING BRIDGE ON A 3.3 PER CENT GRADE.

high-tension direct-current was used on the right of way and city sections respectively.

While the passenger service is electric throughout, steam locomotives are also operated, principally for the purpose of transporting local coal. The great success of the Cologne-Bonn line, which was completed in 1906, has led to the construction of a second line running from Bonn to terminals at Siegburg and Königswinter. While the two roads have no physical connection, their schedules are arranged to harmonize as closely as possible.

The rolling stock of the Cologne-Bonn Railway consist of 21 motor cars each seating 28 second class and 29 third class passengers, nine trailer cars seating a maximum of 72 passengers each, two passenger trailers with postal compartments, three market produce trailers with a seating capacity for passenger use, one parlor trailer, and a number of smaller trailers for various purposes. All cars are of the side-entrance type with special devices for the smokers and non-smokers of each class. The express trains make the 17.6-mile run in 44 minutes and the local trains in 58 minutes.

Gas Electric Locomotive for the Dan Patch Line.

PAST issues of the RAILWAY WORLD have discussed the remarkable success of the Minneapolis, St. Paul, Rochester and Dubuque Electric Traction Company in its operation of gas electric motor cars between Minneapolis and Northfield, Minn. Reference has also been made to the gas leectric locomotive which was being built for this company. While power of this character has been used rather extensively in the operation of motor cars, never before has a locomotive of this character been built. It has proved itself, however, to be worthy of a more extended use; and constant service, since last July, has demonstrated its success in every respect. A speed of 51 miles per hour running light, has been attained and 45 miles per hour with a five-car train, notwithstanding the locomotive is rated at only 38 miles per hour.

The accompanying photograph indicates its general appearance. Fuel consumed is about one gallon for 95 ton miles, and the control is so

GAS-ELECTRIC LOCOMOTIVE RECENTLY INSTALLED BY THE MINNEAPOLIS, ST. PAUL, ROCHESTER AND DUBUQUE ELECTRIC TRACTION COMPANY.

way as on gas electric cars with the additional advantage that after one set is running, the second may be started electrically from the first. Four motors are used instead of two as in the gas electric car, being placed in pairs connected permanently in parallel. The controller provides seven points in the series position and six points in the parallel position. There are also two additional points for shunting the motor fields, thus making fifteen running points in all.

Terminal Improvements

New Grain Elevator at Port Arthur, Ontario.

THE Canadian Government has completed its new grain elevator at Port Arthur, Ontario. It represents the biggest individual elevator in the world. Seventy circular bins of 30,000 bushels capacity, together with 54 interspaces of about 8,000 bushels each, gives a storage house capacity of 2,500,000 bushels. The total capacity of the elevator is 3,250,000 bushels, the balance of the storage room being in the working house which contains seventy-five cir-

In the men's quarters are found a smoking room with easy chairs, wash stands with hot and cold water, and bath tubs, etc. These comforts are free and the men are invited to partake of the bath rooms and in this way refresh themselves. Soap and paper towels are also furnished free. Thus a new lesson in sanitation is provided and one that is not likely to be forgotten.

To show how thoroughly the road has considered the comforts of this class of travelers, it is interesting to note that in the women's section are stationary wash tubs and steam clothes driers in order that the soiled clothing of the children as well as the adults may be cleansed before proceeding on their travels. The women and the children are also provided with proper bathing facilities and special arrangements have been made for meals or light lunches at prices within reach of their scanty resources. It is hardly necessary to state how the food is enjoyed and that perhaps many of the grim impressions which had begun to enter the minds of the weary travelers with regard to the new country and its people, melt away under the stimulating effect of the kindness and consideration shown them.

Other roads besides the Chicago and North Western are making similar efforts to see that the newcomer to our shores receives every consideration possible; which, by the way, is only one of the many thousand efforts constantly being made by the carriers to serve and care for the traveling public.

Report on Chicago Railway Terminals.

MR. BION J. ARNOLD has prepared a report for the Citizens' Terminal Plan Committee of Chicago, on the railway terminal situation of that city. Among other things it calls for co-operation among the various railroads and the City of Chicago, entrances to the city in covered subways and the development and more efficient use of property already held for freight terminals.

Mr. Arnold has based his report upon a study of all the previous reports and upon data furnished him by twenty-eight of the railroads entering the city. He conditionally concurs in the report of Mr. John F. Wallace on the ordinance carrying the union passenger permit but not with those relating to the freight situation. In Mr. Arnold's opinion, the City of Chicago should grant no further ordinances to steam railroads or other railway companies seeking to rebuild their present terminal facilities or to construct new terminals, unless the ordinances contain definite provisions making the following fundamentals mandatory upon the road or roads benefited by them:

An agreement to co-operate with the other railroads affected, and with the city, in straightening the South Branch of the Chicago River.

The placing in covered subways beneath the street level, within a definite time, of all tracks of the steam railroads within the district bounded by Twelfth, Halstead, Lake Street and the lakefront (except the elevated tracks of the new Chicago & North Western Station and such tracks as are now or may hereafter be located within the present depressed area between Canal Street and the Chicago River; also the tracks of the Illinois Central Railroad along the lake front).

An agreement to co-operate with other railroads and the city in working out a plan which will ultimately open practically all of the north-and-south streets between State and Canal Streets, and practically all of the through east-and-west streets between Randolph and Harrison Streets, and also Polk, Taylor, Twelfth, Fourteenth and Sixteenth Streets, which are now blocked by railroad property.

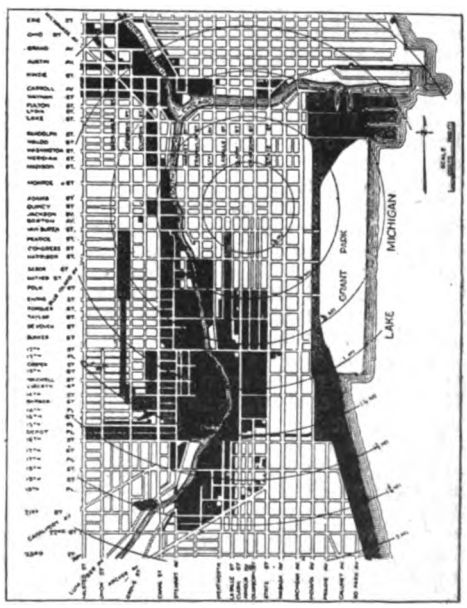
The concentration of long-distance passenger traffic into the fewest number of terminals practicable, and at such locations as will offer the least obstruction to the extension of the business district consistent with reasonable accessibility therefrom.

An agreement to co-operate with the other steam railways and the city in the development to its fullest extent, along the most efficient modern lines, of the property now owned by various railroad companies within, or contiguous to, the business district of the city, with the ultimate object of the complete development of such property, so that the property now occupied by the companies in the business district between State Street and the river can be cacated and devoted exclusively to business purposes or the surface released by placing the tracks under ground and developing the property above the surface for business purposes.

Where streets or alleys are closed, temporarily or for long periods, an equivalent area or value to be given in return by the railroad in widening other streets.

The city to reserve control over all subsidewalk and sub-pavement space, not specifically vacated in the ordinance, that may be required for suburban transportation systems or other public utilities.

An agreement to co-operate with the city in the establishment of elevated thoroughfares



From *Age-Gazette*.

RAILWAY PROPERTY IN THE CHICAGO DISTRICT INDICATED BY BLACK SECTIONS.

Digitized by Google

across the railway property lying between Canal Street and the South Branch of the river, and westward as later may be deemed necessary. This system to be co-ordinated with the bridge levels established by the city and with the necessary changes in north-and-south thoroughfares to equalize the grades so as to facilitate vehicle traffic. The ordinance to provide means for ascertaining and finally to stipulate the division of cost of such changes proportional to the relative benefits derived by the city and the companies respectively.

Provision for a marginal way or river road contiguous to the river, extending along the railroad property west of the river between Lake and Sixteenth Streets, and the development of suitable docking facilities, municipal or otherwise, along the entire way, and underneath the bridge approaches where practicable.

Provision in all passenger stations hereafter constructed for through-connected or interchange tracks, so as to permit interchange of suburban service between roads operating in different parts of the city.

An agreement to co-operate with other roads to interchange the use of coach-yard facilities if necessary to carry out the through-routing or interchange principle for suburban service.

Commitment to the effect that the company will co-operate with the other roads in the working out of a general plan whereby the roads may be systematically grouped and brought into two or more terminal stations with the least amount of track occupancy.

An agreement to co-operate with other railroads and the city in establishing universal facilities at Clearing, or some other point, by means of which package freight (less than carload lots) now interchanged in the down-town district will be interchanged at such clearing point, thus preventing haulage of freight into the business center and back again as is done at present—the effect of which change would be to release present down-town freight facilities for the legitimate use of freight destined to and from the business district.

The removal of obstructions due to railroad occupancy which decrease the width of the river channel as now established, so as to permit the construction of bridges without encroaching upon the river channel.

The granting of an ordinance to the Pennsylvania Company for a passenger terminal, Mr. Arnold finds, need not be conditioned upon the granting of an ordinance to the same company for the use of the proposed freight terminal, for it is not evident that the company would need this additional territory for freight purposes for many years to come, if the roads owning the property between Canal Street and the river would co-operate in developing it to its fullest extent.

By means of double-decking Canal Street the property on the west side of Canal Street would be made available for terminal purposes, and there is no reason why this property should not be used for freight purposes if, after analysis, more space is found ultimately to be needed—provided the tracks are kept underground and the property developed overhead for business or manufacturing purposes.

How far these recommendations are enforceable through the Interstate Commerce Commission or the State Public Utilities Commission should be a subject for further study, but Chicago should now avail herself of the opportunity to regain control of her traffic districts.

Inasmuch as the Chicago Plan Commission has been established, has done such extensive and commendable work for the betterment of Chicago, and has been recognized by having certain of its recommendations carried out, such as the widening of Michigan Avenue and Twelfth Street, and the development of the present Lake Front Park, the city authorities should still further see that no structure is reared by any railroad company which will prevent the ultimate realization of such parts of the original plan laid down by Mr. Burnham as have met with the official approval of the Chicago Plan Commission.

With reference to the magnitude of this problem and the enormous costs and difficulties involved, not only to the railroad companies but also to the city, in the rearrangement of the properties in accordance with the suggestions made, Mr. Arnold states that he does not wish to be understood as counselling any one-sided policy of compulsion on the part of the city for the carrying out of any of the suggestions.

The general method of street improvement and the extension of the business district recommended by Mr. Wallace is concurred in by Mr. Arnold, but the retention of the Pennsylvania freight site is not concurred in, nor the unconditional retention of the passenger terminal site at Adams Street; and, in fact, another site is recommended as preferable. Neither is the premise accepted that present divisional occupancy and operation of railroad properties must govern their ultimate disposition in meeting the necessities of terminal reorganization recommended.

Completion of the Canadian Pacific Railway's St. Lawrence River Bridge.

THE Canadian Pacific Railway has completed its task of reconstructing the St. Lawrence River Bridge between Highland Station and Caughnawaga. Mr. David McNicoll, vice-president of the Canadian Pacific is shown in the accompanying illustration, tightening up the last bolt in the track, thus placing the seal of official approval upon the successful completion of the work.

Those present at the ceremony included in addition to Mr. McNicoll, Mr. Phelps Johnson, general manager of the Dominion Bridge Co.; G. H. Duggan, chief engineer of the Dominion Bridge Co.; A. D. MacTier, general manager, the C. P. R. Eastern lines; P. B. Motley, engineer of bridges, the C. P. R.; H. H. Vaughan, assistant to the vice-president of the C. P. R.; J. M. R. Fairbairn, chief engineer of the C. P. R.; J. K. McNeillie, superintendent of Montreal terminals; F. W. Cowie, chief engineer, the Montreal Harbor Commissioners; M. S. B. Brown, engineer of the C. N. R. tunnel; C. N. Monsarrat, chairman of the Quebec Bridge Commission; and Mr. George Hodge, superintendent of the Eastern lines of the C. P. R.

Interstate Commerce Commission

Death of Commissioner Marble.

THE Commission sustained a sad lose in the untimely death of Commissioner John H. Marble which occurred suddenly on November 21st, and is referred to at greater length in another section of this issue. Mr. Marble while only a young man, had already demonstrated marked ability and was undoubtedly entering a period of great usefulness. His death together with the resignation of Commissioner Prouty and the probable retirement of Mr. Clements, leaves three vacancies soon to be filled by President Wilson. Speculation is rife as to who the successful candidates may be, and rumor has it that politics will play a prominent part in their selection. We believe, however, that the President will exercise the greatest care in filling these positions as he realizes what an important part railway regulation is now playing in the constructive activities of the country and that nothing could do more harm than to place such tremendous responsibilities upon the shoulders of radical and inexperienced men. It has been very clearly shown within recent months that the point has been reached where railway regulation must develop a high order of intelligence, fairness and constructiveness if National growth and prosperity is to be properly conserved.

Numerous candidates have been mentioned for these positions, including Martin S. Decker and Milo L. Maltbie, of the New York Public Service Commission; D. O. Ives, chairman of the Transportation Committee of the Boston Chamber of Commerce; Patrick J. Farrell, solicitor of the Commission; ex-Governor Glenn, of North Carolina, and a number of others. No official announcement has been made as yet regarding those to be selected, but the name of David O. Ives has been so prominently and persistently mentioned in connection therewith, that it is thought probable that he will be offered one of the commissionerships. Mr. Ives' experience fits him admirably for a position of this character, he having been formerly a railway manager in Iowa and was for some time a commissioner of the Trunk Line Association. He is said to have the support of the majority of Congressmen from Massachusetts.

The Advance Rate Hearings.

MUCH of the Commission's time at present is being consumed in considering the advance rate cases in which the Eastern carriers are asking permission to make a horizontal increase of five per cent in the freight rates in Official Classification territory. The Commission recognizes the importance of the case and the desirability of having it settled as quickly as possible, and every effort is being made to accomplish this end. The testimony being offered, however, is voluminous and will undoubtedly take many months, after it has all been presented, to study and digest. The opening statements made by President Willard, of the Baltimore and Ohio, and by F. A. Delano, receiver for the Wabash, are printed in full in another section of this issue, as well as a more extended reference to the daily hearings which have so far been held. Unusual interest in the case is manifested in official circles and the consensus of opinion appears to be that some increase will be granted.

Civil Service Examination for Railway Valuation Land Appraisers.

THE United States Civil Service Commission has announced open competitive examinations for senior and junior land appraisers (male) for positions in the Interstate Commerce Commission, under the act providing for the valuation of the property of common carriers. Two grades of senior land appraisers will be established, the salaries in the first grade ranging from $2700 to $3600 per annum, with necessary expenses when absent from headquarters in the discharge of official duties, and in the second grade from $1800 to $2400 per annum and such expenses. The junior positions will command salaries of from $900 to $1500 per annum, with expenses. Appointment to these positions will be principally for duty in the field, but some appointments will be made for duty in Washington, D. C. Applicants for the senior positions will not be required to appear at any place for examination, but will be rated upon the evidence adduced as to their general and technical education and training and their practical experience and fitness.

It is desired to secure eligibles having qualifications for service in land appraisal and inventory work. Applicants should state fully and in detail in the application form, under the following headings, their education, training, experience, and fitness: (a) Education and training. (b) Preliminary experience in offices of real estate agencies, abstract companies, title-insurance companies, tax assessors, or railway land or legal departments. (c) Service in connection with the surveying of lands, examination of titles, purchase and sale of real estate, land litigation, or in land or legal departments of railways. (d) Experience in appraisal and inventory work. (e) General business, legal, or engineering experience other than above enumerated. Applicants for positions under grade 1, senior, must show that they have had at least eight years of satisfactory, responsible experience in connection with the purchase, sale, assessment, or appraisal of land; applicants for

Digitized by Google

grade 2, senior, must have had five years of such experience; experience in the examination of titles or incidental experience in the sale of land in connection with general legal practice will not be accepted.

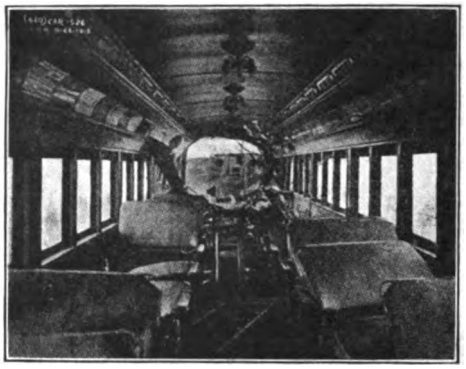
For the senior positions under grade 1 applicants must have reached their 30th but not their 60th birthday, and for grade 2 they must have reached their 25th but not their 45th birthday on the date of the examination. Applicants for the junior positions must show that they have had satisfactory experience in connection with the purchase, sale, assessment, or appraisal of land for at least three years, and must have reached their 21st but not their 45th birthday on the date of the examination.

Persons who meet the requirements and desire these examinations should at once apply for form 1312 to the United States Civil Service Commission, Washington, D. C.; the secretary of the board of examiners, post office, Boston, Mass.; Philadelphia, Pa., Atlanta, Ga., Cincinnati, Ohio, Chicago, Ill., St. Paul, Minn., Seattle, Wash., San Francisco, Cal.; customhouse, New York, N. Y., New Orleans, La., Honolulu, Hawaii; old customhouse, St. Louis, Mo.; or to the chairman of the Porto Rican Civil Service Commission, San Juan, Porto Rico. No application will be accepted unless properly executed and filed with the Civil Service Commission at Washington, in complete form, prior to the hour of closing business on December 22, 1913.

Report on Long Island Wreck.

THE Commission's chief inspector of safety appliances has issued his report covering his investigation of the head-on collision which occurred on the Long Island Railroad near College Point, L. I., on September 22nd, resulting in the death of three employes and one passenger and the injury of forty-four passengers, six employes on duty and four employes off duty. Briefly stated, the accident was caused through the negligence of a towerman who permitted a train to go through without having received the necessary information regarding a train coming from the opposite direction. It was

FIRST CAR OF WESTBOUND TRAIN NO. 311. END VIEW.



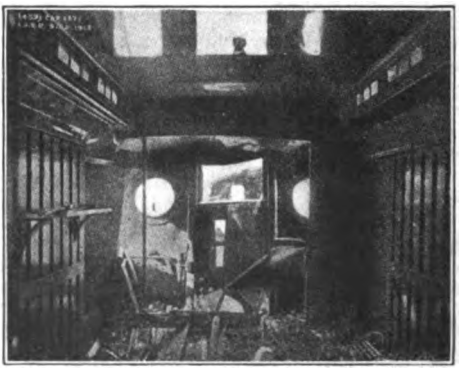
INTERIOR VIEW OF FIRST CAR OF WESTBOUND TRAIN.

apparently another one of those cases of chance-taking and disregard of company rules. The branch on which the accident occurred is a single track line only 4.6 miles in length. Trains are operated by electricity and no block system was in use, operation being controlled by

FIRST CAR OF EASTBOUND TRAIN NO. 308. EXTERIOR VIEW.

time-table rights and by train orders transmitted by telephone.

The colliding trains were westbound train No. 311, consisting of one motor passenger car and one motor combination baggage and passenger car, each of steel construction and eastbound



FIRST CAR OF EASTBOUND TRAIN. INTERIOR VIEW.

Digitized by Google

train No. 308, consisting of one motor combination baggage and passenger car and four motor passenger cars, all of steel construction.

The Commission has investigated a number of accidents in which a portion of the equipment involved was of steel construction, but this is the first head-on collision where all the cars of both trains were constructed of steel. It is, therefore, of particular interest to note the conditions of the cars involved in the accident as shown by the accompanying illustrations.

The forward end of the leading car in train 311, was crushed, the side sills being buckled inward and the center sills buckled upward. The interior of the car was also considerably damaged by the shock: of the collision.

The forward trucks of the leading car in train 308, were forced upward under the body of the car for nearly half its length and were followed by the forward trucks of the leading car in train 311. The forward end of the leading car in train 308, was also damaged but not to the extent of the leading car in train 311. The sills remained true but the floor was forced upward in the center of the car by the dynamo and auxiliary reservoir being caught betwen the floor and the forward trucks when the latter were driven backward.

It is interesting to note that on September 18th, four days previous to the accident, authority had been given by the general manager of the Long Island Railroad to install a manual block system on the branch on which the accident occurred. At noon on September 22nd, two days after the accident, such a block system had been placed in operation.

Order Covering Water Line Permits.

THE Commission has sent a notice to all rail and water carriers to the effect that railroads wishing to continue their ownership of steamship lines operating through the Panama Canal after July 1st, of next year, will have to apply for such permission from the Commission not later than March 1st next.

Under the law the Commission is given the power to decide when the railroad ownership of a ship line is not injurious to the public good and does not tend to restrict competition. In cases where competition is not hindered the Commission has the authority to permit the continuance of the railroad ownership of a steamship line.

To Re-argue Tap Line Case.

ALTHOUGH the Commission has perfected an appeal to the Supreme Court of the United States from the recent decision of the Commerce Court in the case known as the Tap Line Case, nevertheless on its own motion the Commission has concluded to order a re-argument in that case. This action was taken not only in view of the opinion of the Commerce Court handed down recently, but also because the Commission has felt that a re-argument of the case both on the facts and the law and upon such additional facts as might be developed would be beneficial.

In order to avoid any delay in the progress of the appeal in the Supreme Court, the re-argument has been set for January. At its conclusion the Commission will be sufficiently advised as to enable it to prosecute the appeal or to determine how far, if at all, its order in the tap line case should be modified.

Freight Car Statistics.

THE Commission has completed an investigation into ownership of freight cars in the United States, and for the first time since the Commission was created it has definite figures as to the number and character of freight equipment of American railways.

According to the Commission's figures there are in the United States 2,300,000 freight cars owned by the railroads and 140,000 cars owned by car companies or other private ownerships. Private parties own more refrigerator cars than the railroads, the private car lines owning 54,000 and the railroads 49,000.

The investigation developed that there are 43,000 freight cars in the United States used for no other purpose than for the transportation of automobiles.

Car Supply Ruling.

THE Commission has issued a decision to the effect that each interstate railroad "is charged with the duty of furnishing cars for the transportation conducted over its line," quite irrespective of any contract one railroad may have entered into with another providing for a joint supply of cars.

The decision concerned the rules governing the distribution of coal cars in times of car shortage by the Colorado & Southern, the Denver & Rio Grande, and the Colorado & Southeastern. The Commission held that the contract, as to car distribution, between the first and last of these lines, caused undue discrimination among shippers, and, therefore, was unlawful.

Export Grain Rates Attacked.

THE New York Produce Exchange has filed a petition with the Commission attacked east-bound rates and regulations of the Eastern railroads on grain, flaxseed, and like commodities, from Western and Northwestern States. It is charged that traffic in grain is, through present rates and regulations, being diverted to Montreal from Eastern ports of the United States, particularly New York, and that the rates are excessive and discriminatory.

Demand is made that a sliding scale of grain rates, according to seasons, be made effective, and that the discriminations and preferences complained of be removed.

State Commissioner to Co-operate in Valuation Plans.

THE Valuation Committee of the National Association of State Railway Commissioners, met in Chicago, on December 10th, to take action to insure co-operation by the State organizations with the Interstate Commerce Commission in the pending valuation of the railroads of the country. It was asserted that future State valuations would be governed before the courts by the valuation to be made by the Interstate Commerce Commission, and that it was essential that the State Commissions should work side by side with the National

Digitized by Google

Commission in order to assure justice to themselves and avoid future conflicts.

Steps to obtain recognition by the National Commission will be taken.

Canadian Railways File Tariffs of Increased Rates.

THE Canadian Pacific, Canadian Northern and Grand Trunk Railways have filed with the Board of Railway Commissioners of Canada and with the Interstate Commerce Commission freight tariffs effective November 15th advancing all rates approximately five per cent, both class and commodity, on their lines east of Port Arthur between points in Canada and the United States, the advances to apply in the United States east of Chicago and north of the Ohio River. The same advances are proposed on import and export traffic to and from all Eastern Atlantic ports, both Canadian and United States. These advances are made in sympathy with similar advances that were proposed to be effective on the same date in the Eastern United States. They apply on all raw material, such as coal, iron, lumber, etc., brought into Canada by manufacturers and to paper, wood pulp and such commodities as are exported to the United States and more under commodity tariffs.

Investigation of Louisville and Nashville.

IN compliance with the Lea resolution adopted by the United States Senate on November 6th, the Commission has begun an inquiry into the financial operations and relations of the Louisville & Nashville Railroad Company, the Nashville, Chattanooga & St. Louis Railway, and affiliated lines.

The investigation, ordered recently by the Senate, is expected to disclose whether there be any interlocking ownership of the stock, bonds, or other securities of the roads; whether competition between the lines in the same territory is being maintained; whether competition is prevented by agreements entered into among the roads; whether the roads involved in the inquiry have subscribed or expended money to prevent other roads from entering their territory, or to maintain political or legislative agents, or to influence public sentiment in favor of the plans of the several lines, and whether the law is being violated with respect to the issuance of passes.

No time has been fixed for hearings, but the Commission will begin at once the collection of data bearing upon the inquiry, and later will announce the times and places of the formal proceedings.

Higher Rates for Cereals Carrying Premiums.

BY dismissing the complaint of the Minneapolis Cereal Company against the Chicago Northwestern, the Commission has placed its stamp of approval to the practice of the railroads of charging a higher rate on commodities in which premiums are packed. In this instance silver plated spoons were inclosed. Western classification provides that the rate on a commodity when containing a premium shall be 110 per cent of the rate on the commodity alone. A somewhat similar provision is applied by the roads operating in official classification territory.

The decision of the Commission said: "To be able to ship premiums in packages is a privilege of value to the shipper. This complainant states that it would not handle premiums if it were necessary to ship them in separate packages. It was demonstrated of record that as to certain carloads of 'cream of rye' which had moved in Western classification territory the rules complained of operated to make the total charges less than those which would have accrued if the carload rates had been applied to the weight of the cereal and the appropriate less-than-carload rates to the actual weight of the spoons contained in the packages. Probably as a result of this showing counsel for complainant announced at the argument that there was no objection to the maintenance of the present rules with respect to carload traffic."

Ruling on Storage Rates.

THE Commission has rendered a decision relative to proposed uniform storage rules and rates of roads in Central Freight Association territory, which have been under suspension for some time. The Commission passes upon them only so far as they apply to explosives which are classified as "dangerous" and "most dangerous." It holds that the rules should be revised and modified because they are unreasonable—providing for doubling the charges after the expiration of the free time allowed on "most dangerous" explosives and reducing the free time from 48 to 24 hours on the "dangerous" articles in addition to doubling the charges after that time has been passed.

The Commission adds:

"In view of the amount and penal nature of the charges, carriers should co-operate with shippers in avoiding hardships that might result from the operation of the rules, to the extent of notifying shippers, upon request properly made at the time of tendering shipment, of the failure or refusal of consignees to accept or remove shipments.

"We are of the opinion that the proposed rules, even as modified, would be unreasonable unless provision for such notification should be contained in the tariffs. Notice should be mailed unless the shipper request that it be sent by telegraph at his expense."

Steel Passenger Car Problem.

RAILROAD officials have begun a campaign to obtain action by Congress delegating full power to the Commission in dealing with the steel passenger car problem.

Chairman R. B. Stevens, of the sub-committee on interstate and foreign commerce of the House has announced that a series of hearings on the subject will begin within the next few weeks. Several bills pending in Congress provide for the substitution of steel passenger cars for wooden equipment and plans have been made by Representative Stevens to obtain the views of a large number of railroad officers and car builders on the question.

One of the important reasons why this matter should be in the hands of the Commission

Digitized by Google

is that it is out of the question to draw a bill fixing the time in which steel cars must be completed, owing to the lack of knowledge as to what the car building capacity of the country is going to be. With the matter in the hands of the Commission, however, they could demand the substitution of steel cars for wooden ones as fast as it is practicable and keep in touch with the entire situation. This was the method pursued in equipping the railroads with automatic couplers and other safety devices and has proven entirely satisfactory both to the Government and to the public.

Railway Accidents.

THE Commission has issued its accident bulletin for the quarter ending June 30, 1913. This shows that as compared with returns of the corresponding quarter of 1912, there was a total increase of 140 in the number of persons killed and of 8,823 in the number injured in railroad accidents of all kinds in the United States. There was an increase of 124 in the number of train accidents. Defective roadway and defective equipment together caused more than 39 per cent of all derailments reported, 15.1 per cent being caused by broken rails.

The total number of casualties in all classes of accidents, incident to railroading during the quarter, was 2535 killed and 49,011 injured. Of these totals 2,286 were killed and 16,868 injured in other than train accidents, including accidents to employes while at work, to passengers getting on or off cars and to trespassers.

The total number of collisions and derailments reported for the quarter was 3,596, of which 148 collisions and 202 derailments affected passenger trains. The financial damage caused by the accidents was $3,324,289, a material increase over the returns for the corresponding quarter of 1912.

California Steamship Line Demands Joint Rates.

THE Pacific Navigation Company operating in Pacific waters from San Francisco, has begun a proceeding before the Commission against the Southern Pacific Company and other transcontinental railroads, demanding that the railways make through routes and rates with the complainant on passenger traffic.

Discrimination against the Pacific Navigation Company was alleged in denying its membership in the Transcontinental Passenger Association, which automatically would entitle it to the through routes and joint rates.

ORGANIZATION NOTES.

Annual Meeting of National Civic Federation.

THE National Civic Federation held its annual meeting in New York, on November 12th. The address of its President, the Honorable Seth Low, is of peculiar interest to railway officials in that it dealt largely with some of the problems now confronting railway management. President Low advocated that the carriers be granted permission to raise their freight rates but he also suggested that it might be wise to make some readjustment on a downward scale in passenger rates. He held that in a general way, United States railroads charged more for passenger traffic and less for freight traffic than the government-owned roads of Europe. Furthermore, he contended that a lowering of passenger tariffs would be a popular move and therefore prove beneficial in a number of ways.

Mr. Low pointed out that through recent arbitrations the operating expenses of railroads in Eastern territory have been increased by many millions, and that if roads are thus compelled by legislation and arbitration to increase their expenses, as a matter of justice they should be permitted to increase their earnings, otherwise they will be left in a sorry plight. He said that the flow of capital into American railroad securities is likely to be checked until this anomaly is ended.

Continuing Mr. Low said in part:

'The actual situation of the railroads at the moment seems to me so serious that if this application for an increase of freight rates is declined, I fear the impulse that will be given to the demand for the public ownership and operation of the steam railroads of the country will be inevitably strengthened. In a spirit of despair, men who know better will be apt to say: 'That is the only way,' and out of despair, I need not remind you, wise counsels seldom come. I make no apology, therefore, for pointing out briefly on this occasion some of the difficulties attaching to Government ownership and operation of railroads in a country like ours, with a Federal Government, evolved as ours has been, covering half the continent.

"Such information as I can command leads me to believe that in Germany, France, Australia, Italy and Austria the earnings of the State-owned railroads in each country barely equal, if they do equal, the sums paid in taxation by the railroads of the United States. The freight rates prevailing in those countries are uniformly higher, I believe, than the freight rates prevailing in the United States; but it is noticeable that the average passenger rate, disregarding the division by classes obtaining there, is lower in some, and I think in all, of those countries than here. This is largely due, no doubt, to the fact that the multitudes there travel third class, and are given accommodations that would not be acceptable here.

"I wonder if our railroad managers have ever noticed that where Government ownership obtains passenger fares for the multitude are less than the passenger fares in the United States, although in the United States the freight rates are only one-half the rates paid in some countries, while our railroads pay double the wages. First class passenger rates abroad are apt to be higher than the prevailing rate here. This only emphasizes how much more cheaply the multitude travel who travel third class, when the average passenger fare in Germany, for instance, is only half what it is in the United States.

"Our railroad managers, if they would think for a moment as Government officials think when they are charged with the duty of operating railroads, would realize that passengers vote, but freight does not. Any policy, therefore, which reduces the passenger rates is likely to be uni-

Digitized by Google

versally popular, and I take it that is why passenger rates are so low where the State owns the railroads. Whereas the policy which reduces freight rates, while keeping passenger rates high, is popular only with the shipper. It is true that every person who consumes anything carried by rail pays, theoretically, a part of the freight rate charged for that transportation; but the percentage, in any given case, is almost infinitesimally small, and the resultant charge for freight borne by a workingman's family is small beyond recognition compared with the addition of even five cents to the cost of his daily journey to and from work."

Fifty-Eighth Annual Convention of General Passenger and Ticket Agents' Association.

THE American Association of General Passenger and Ticket Agents have issued the proceedings of their Fifty-eighth Annual Convention, held at the Bellevue-Stratford Hotel, Philadelphia, on October 14th and 15th. Aside from the various committee reports, the convention was addressed by a number of prominent railway officals, including George W. Boyd, passenger traffic manager of the Pennsylvania Railroad; C. L. Hunter, vice-chairman of the Trunk Line Association; George D. Dixon, vice-president of the Pennsylvania Railroad; W. M. Acworth, a noted railway economist of England; W. J. Craig, passenger traffic manager of the Atlantic Coast Line; W. S. St. George, general passenger and ticket agent of the Missouri, Kansas and Texas Railroad; Joseph Richardson, chairman of the Southeastern Passenger Association; H. J. Rhein, general passenger agent of the Cleveland, Cincinnati, Chicago and St. Louis Railway; J. F. Mitchell, ticket auditor of the Atchison, Topeka and Santa Fe Railroad; F. J. McWade, general baggage agent of the Pennsylvania Railroad; J. A. McKensie, city passenger and ticket agent of the Grand Trunk Railway, and F. W. Conner, district passenger agent of the Pennsylvania Lines. The election of officers resulted as follows: President, W. J. Craig, passenger traffic manager of the Atlantic Coast Line; vice-president, Gerrit Fort, passenger traffic manager, Union Pacific Railroad; secretary, W. C. Hope, general passenger agent, Central Railroad of New Jersey. The personnel of the new executive committee is as follows: J. C. Hail, chairman; A. M. Cleland, W. F. Herman, W. H. Callahan, George W. Boyd, L. W. Landman and C. B. Ryan.

The address by Mr. George W. Boyd, passenger traffic manager of the Pennsylvania Railroad, which bears directly upon the relations between the public and the railways and which is therefore of peculiar interest at the present time, is reproduced in another section of this issue.

Railway Fire Protection Association Organized.

THE successful organization of the Railway Fire Protection Association was accomplished in Chicago at a meeting held at the Hotel Shoreham, on October 7th, over thirty railroads being enrolled as members. A rapid growth is anticipated on account of the vital importance of the movement.

A number of important addresses were delivered, including one by Mr. Charles N. Rambo, of Philadelphia, on "Fire Protection Applied in a Broad Sense to Railroad Properties," and another by Mr. A. D. Brooks, of Chicago, on "Spark Hazards." Colonel W. B. Dunn, chief inspector of the Bureau of Explosives, also addressed the Association and a most interesting paper was read by Mr. E. B. Berry, chief inspector of the Southern Railway, on "Causes of Fires." Other papers included one on "Building Construction," by Mr. Anson Murphy, fire prevention inspector of the Alabama Great Southern Railroad, one on "Fire Organization," by Mr. B. S. Mace, of the Baltimore and Ohio, and one by Mr. P. Hevener, of the Rock Island Lines, en-

GENERAL PASSENGER AND TICKET AGENTS PHOTOGRAPHED AT THEIR RECENT CONVENTION IN FRONT OF THE UNION LEAGUE, PHILADELPHIA.

Digitized by Google

titled "How a Locomotive May Be Used to Extinguish a Fire." The officers of the new organization are: F. H. Elmore, president: C. B. Edwards, secretary and treasurer, and P. Hevener, vice-president.

Railroad Session of A. S. M. E.

THE American Society of Mechanical Engineers which held its annual convention in New York, December 2-5, devoted one afternoon to a railway session. On this occasion two papers were presented, one on "Steel Frame Box Cars," by Mr. R. W. Burnett, general master car builder of the Canadian Pacific, and one on "Steel Underframe Box Cars," by Mr. G. W. Rink, mechanical engineer of the Central Railroad of New Jersey.

Mr. Burnett, in his paper on steel frame box cars, considered the development of this type of car and outlines some of the factors which have been responsible for it. The practice on the Canadian Pacific, particularly in reference to the repairs, and the advantages of this type of car, were considered and special attention was directed to the methods of selecting and treating the lumber for the sheathing and lining.

Mr. Rink, in his paper, presented several tables showing the practice of a number of roads regarding the dimensions of various parts of box cars. These tables were prepared with a view to making it possible to select a design which would render the best practice. Mr. Rink believes that further steps should be taken toward adopting standards for use on the box cars of the railroads generally and suggests that a committee representing the different roads should be appointed with a view to developing a standard box car.

This is the first time that the merits of these two types of cars have been discussed so thoroughly by technical associations. Both of the papers cover the subjects which they deal with comprehensively. A number of railroad officers participated in the discussion which followed.

Meeting of Traffic Club of Chicago.

ON November 25th, Mr. Samuel O. Dunn, editor of the *Railway Age Gazette*, addressed the Traffic Club on "The Railroad Employe and the Railway Patron." He dealt especially with the effect both on the railway and on the traveling and shipping public of the changes and working conditions of employes that recently had been taking place as the result of legislation and arbitration proceedings.

Monthly Meeting of Richmond Railroad Club.

AT the October meeting of the Richmond Railroad Club, the members were addressed by Mr. W. Shoemaker on "Regulations of the Interstate Commerce Commission on Handling Dangerous Articles." He stated that in view of the safety first movement, operating officials should be imoressed with the importance of carrying out the regulations of the Commission as to the transportation of dangerous articles. He called particular attention to the following points in these regulations:

"It is absolutely forbidden to ship or to carry any explosives in passenger cars, except small arms ammunition and the necessary signals to operate the train, like torpedoes and railway fusees, and if you discover anyone shipping or carrying explosives in passenger cars the matter should be reported to your superior officer in order that he may take proper action. There are certain responsibilities placed upon the manufacturers, the shippers and the railroads. The manufacturers are required to pack their dangerous articles carefully and according to certain requirements and also to tell the railway not only the name of the shipment, but also its character; that is, whether it is dangerous or not. The railroads are required to see that they get this information and then to handle the packages and the cars containing them carefully. This is the business of all railroads, first securing the information as to the danger from the shippers and then acting upon it in order to secure safety in transportation."

Monthly Meeting of Canadian Railway Club.

THE October meeting of the Canadian Railway Club was of unusual interest to its members on account of the lecture delivered by Mr. R. F. Uniacke, bridge engineer of the National Transcontinental Railway on the construction work of that line. The lecture was illustrated by a number of lantern slides which carried the audience into a wild and unsettled country in which great engineering feats had to be accomplished before the road became a possibility. Mr. Uniacke confined himself largely to bridge and viaduct construction over which he had immediate supervision and which constituted the greatest problem in the building of the line. As he pointed out in the course of his lecture, there are on the railway between Moncton and Winnipeg over 200 bridges which, if put together, would extend about eleven miles. In their building 61,000 tons of steel were utilized and the cost of their construction was somewhat over $6,000,000.

Many unusual difficulties were encountered, in cluding a number of land slides which displaced embankments and trestles and in one case displaced a concrete abutment of a bridge to such an extent as to make it necessary to use a permanent low steel trestle instead of the embankment.

On account of the extreme cold in that section of the country, work was often conducted under

the most severe weather conditions, the temperature at times falling as low as 50 degrees below zero.

The accompanying photographs, showing a diver going down through the ice in order to examine a foundation in the river bottom and a dog team and residency used in the winter months, give some idea of the unusual conditions encountered.

November Meeting of New York Railway Club.

ON November 21st, the members of the New York Railway Club had the pleasure of listening to Mr. Daniel M. Brady, president of the Brady Brass Company, discuss the past, present and future of railway clubs. Mr. Brady dealt particularly with the organization and development of the Master Car Builders' Association, of which he has an intimate historical knowledge.

He pointed out that the New York Railway Club, the pioneer of such organizations, was informally organized during the winter of 1871-2 by Leander Geary, master car builder of the New York and Harlem Railroad, and a few associates and co-workers. This organization, however, was known as the Master Car Builders' Club until 1889, when the name was changed to that of the New York Railway Club.

In speaking of the developments of other railway clubs, Mr. Brady had the following to say:

"The formation of the New York Railroad Club seemed to pave the way for similar organizations, and other railway clubs were organized in different parts of the country, until to-day there are more than twelve railroad and railway clubs in the United States, holding periodical meetings during the season extending from September to May inclusive, and having an estimated membership of nearly 7,000 members. The work and growth of these railway clubs is known very generally throughout the country by nearly all railway men and many others outside of the immediate railway circle.

"To systematize, simplify and make certain methods and lines of work alike as far as possible to the secretaries of all the clubs, the idea was conceived by a few of the more prominent members of those who were interested in the work that some organization of the secretaries of the various clubs would be of great value along the lines mentioned.

"Accordingly, a meeting was called for the purpose of such organization at the Gilsey House, New York, December 1, 1896, the secretaries of the then existing railway clubs being invited to attend.

"At this meeting a permanent organization was effected, the name adopted being 'The Society of Railway Club Secretaries of the United States.' This was later changed to 'Society of Railway Club Secretaries.' Since the society was formed annual meetings have been held, and some of the systems adopted have been the uniformity toward rates of advertising, methods of registering members, colors assigned for the various clubs' proceedings, but the most important standard adopted was regulating the systematizing of the exchange of clubs' proceedings with other clubs upon a business basis.

"This and the admittance of the railway clubs' proceedings at second-class rates by the Postoffice Department, has saved to each club many hundreds of dollars."

Rate Advance Resolutions Passed by the Chicago Association of Commerce.

THE freight traffic committee of the Chicago Association of Commerce has adopted resolutions expressing the Association's position with regard to the proposed five per cent advance in interstate freight rates in the territory known as Official Classification territory. The resolutions follow:

"Whereas, The railroads in the so-called Official Classification territory filed a petition with the Interstate Commerce Commission to reopen the so-called general rate advance case (heard and decided adversely to the carriers about two years ago), to the end the carriers in said territory be permitted to advance all interstate rates five per cent; and

"Whereas, Said petition has been denied in lieu thereof the Commission will proceed to a general inquiry into the subject, and

"Whereas, The freight traffic committee of the Chicago Association of Commerce has held many meetings to consider and determine their attitude respecting the question, which they recognize as of great importance to the members of the Association,the carriers, as well as the public at large; and therefore be it

"Resolved, That the attitude of this committee is as follows:

"First. The committee is in sympathy with the plan of having the question adjudicated by the Interstate Commerce Commission, that body to determine from the facts the necessity for said proposed advance and the reasonableness of the rates to be established thereby. The committee look upon this proposed advance in the all-rail rates as experimental. If the benefits arising therefrom are mutual and of a permanent nature, the increase may be justified. If, on the contrary, the results are not permanent and a request for another increase in rates follows, it will demonstrate that advances in rates do not meet the issues involved, nor provide a remedy for existing conditions.

"Second. The committee especially invites the Commission's attention to the fact that the movement toward higher transportation charges in Official Classification territory has, in the past, fallen to an undue and unreasonable extent upon

Digitized by Google

the rail-and-lake rates. If the claim of the carriers be conceded that increased cost of operation, taxes, and a return upon additional capital justifies some increase in all-rail interstate rates, we respectfully submit that such claim cannot and does not apply to the rail-and-lake rates, which have been advanced three times since 1900 (a total of approximately 11 per cent), without any change in the all-rail rates, which fact not only debars the claim that a fixed relation exists between the all-rail and rail-and-lake rates that requires them to be similarly changed, but establishes the further fact that traffic moving under these rates has already contributed in full measure to any reasonable advance. We therefore are irrevocably opposed to any advance in the present rail-and-lake rates. Be it further

"Resolved, That a copy of this resolution be sent to the Interstate Commerce Commission."

Meeting of American Railway Association.

THE American Railway Association held its fall session in Chicago on November 19, with 210 presidents, general managers and operating officials in attendance. There are now 402 members with jurisdiction over 269,317 miles of railroad.

The committee on the standard code of train rules reported that the present code is satisfactory if properly interpreted and rigidly adhered to, and also that it must be thoroughly satisfied as to the advantage in safety or efficiency of any changes before making any recommendations.

Modifications in the specifications for carbon-steel rails, as provisionally approved in 1912 by the Association, to provide for a variation of ⅜ inch instead of ¼ inch from the specified length, were referred to the American Railway Engineering Association for its consideration and recommendation. Likewise questions of the contour of chilled car whels and the throat clearances for frogs, crossovers and guard rails have been referred to the Engineering Society and to the Master Car Builders' Association.

The joint committee on automatic train stops reported changes from the tentative report in May. After discussion the report was referred back to the committee.

The electrical working committee has given attention to questions of overhead working conductor clearances and to the clearances for automatic train stops, but it desires that conclusions be reached by the technical associations before recommending action.

Mr. D. L. Bush, vice-president of the Chicago, Milwaukee and St. Paul Railway, and Mr. C. W. Galloway, general manager of the Baltimore and Ohio Railroad, were elected members of the committee on nominations.

International Engineering Congress for 1915.

AN effort is to be made in connection with the Panama-Pacific Exposition to establish an International Engineering Congress, whose sessions will be held during the week of September 20, 1915. An organization has already been perfected and the movement is well under way.

The purposes of the congress are: The gathering together of a large and representative body of engineers from all civilized countries, with the opportunities which this will present of forming or renewing personal acquaintances, and of interchanging views on the various phases of professional work; and the reading and discussion of papers before the various sections, and their later publication in such form as to constitute a valuable addition to engineering literature. The Congress is to be conducted under the auspices of the following five national engineering societies, namely, the American Society of Civil Engineers, the American Institute Mining Engineers, the American Society of Mechanical Engineers, the American Institute of Electrical Engineers, and the Society of Naval Architects and Marine Engineers. The organization and conduct of the Congress have been placed in the hands of a committee of management consisting of the presidents and secretaries of these five societies, and of eighteen other members representative of them and resident in or near San Francisco. While the engineering features involved in the construction of the Panama Canal are to receive conspicuous attention, and Colonel George W. Goethals, chairman and chief engineer of the Isthmian Canal Commission, is expected to act as honorary president of the Congress and has promised to preside in person over its general sessions, it is intended that the Congress shall be truly international in scope and that it shall embrace, in a thorough and comprehensive manner, the various branches of the engineering profession. The secretary of the Congress is Mr. W. A. Cattell, Foxcroft Building, San Francisco, Cal.

Convention of Foundrymen.

THE recent convention of Foundrymen, held in Chicago, was unusually successful. During the same week, conventions of the American Institute of Metals and of the Associated Foundry Foremen were also held and in the International Amphitheater was displayed a most comprehensive exhibit of foundry apparatus, equipment and accessories, supplemented by a modern machine tool display. Taken all together, the exhibit was the most comprehensive of its kind ever attempted.

A New Railroad Association Organized.

THE Short Line Railroad Association of the Southeast has been organized with the following officers: President, J. W. Oglesby, Quitman, Ga.; vice-president, L. T. Nichols; secretary, C. B. Lucas; state vice-presidents, W. M. Blount, Alabama; W. B. Denham, Florida; R. B. Coleman, Georgia; R. K. Smith, Mississippi; J. E. Hancock, North Carolina; W. H. Patterson, South Carolina; W. B. Townsend, Tennessee; W. E. Mingen, Virginia. The purpose of the organization is to unite the influence of the short lines for the protection and advancement of the properties, in much the same manner as the General Managers' Association of the Southeast serves the trunk lines of that part of the country.

Annual Election of Cincinnati Railway Club.

THE Cincinnati Railway Club held its annual election and dinner November 11. The following officers were elected: President, Henry B. Voorhees, general superintendent of the Cincinnati, Hamilton and Dayton and Cincinnati Terminal division; first vice-president, W. R. Hudson, general superintendent of the Kentucky general division of the Chesapeake and Ohio; second vice-president, C. H. Rae, assistant superintendent machinery of the Louisville and Nashville; secretary, Henry Boutet, chief interchange inspector; treasurer, W. Holmes, Galena Signal Oil Company; sixth member of the executive committee, C. E. Rickey, superintendent terminals of the Queen and Crescent. Vice-president T. C. Powell, of the Queen and Crescent, was the principal speaker, his subject being "Co-operation."

LEGISLATION.

Coastwise Traffic and Tolls.

IT seems safe to assume that the present session of Congress is likely to give some consideration to the subject of Panama Canal tolls. In this connection, it is therefore of interest to note what has already been done in an effort to legislate on this question.

Senator Root, of New York, by S. 96, and Mr. Sims, of Tennessee, by H. R. 1922, would amend the Panama Canal Act by striking out the words "no tolls shall be levied upon vessels engaged in the coastwise trade of the United States."

A bill was introduced by Mr. Newlands, of Nevada, S. 923, which would amend the Act of August 24, 1912, by exempting from tolls all vessels belonging to the United States Government. This bill introduced by Mr. Newlands also takes into consideration a toll system so that the totals collected would not exceed the cost of operation and amount of fair interest on investment. It also provides a system for reaching the proper charge for foreign vessels by assuming to deduct from the estimated cost and interest the amount lost by making deductions in favor of American vessels, thus arranging that no cost of these deductions would fall on foreign shipping.

Mr. Humphreys, of Washington, by H. R. 2896, would prevent shipments in combines and conferences from passing through the Panama Canal.

Mr. Burton, of Illinois, by H. R. 4479, goes further than merely the exemption of the American coastwise shipping from tolls, and he would amend the Interstate Commerce Act so as to bring all coastwise shipping as carriers within the meaning of the Act and therefore amenable to the Interstate Commerce Commission.

Mr. Steenerson, of Minnesota, by H. R. 5847, would prevent monopoly in the coastwise trade between Atlantic and Pacific coast ports of the United States via the Panama Canal by allowing vessels of foreign registry to engage in such trade upon payment of canal tolls.

Mr. Moore, of Pennsylvania, introduced two bills and one joint resolution. The first, H. R. 3377, repeals the section of the Panama Canal Act which provides for free entry of foreign material for the construction or repair of vessels, either machinery or equipment. The second, H. R. 3378, proposes to create a Panama Canal Trade Commission of seven members, five to be citizens of the United States.

The duties of the Commission shall be to investigate and report to the President the advantages of the Panama Canal to the commerce of the United States with Central and South America. The third, House Joint Resolution 68, proposes that the Secretary of State shall confer with Great Britain and other nations with a view to their participation in the cost of construction and maintenance of the Panama Canal and thus bring about its neutralization.

Mr. Pomerene, of Oregon, by Senate Joint Resolution 22, proposes to abrogate the Clayton-Bulwer and Hay-Pauncefote treaties in order to dispose of the question of our right to exempt American coastwise trade from the payment of Panama Canal tolls.

Government Ownership.

AS government ownership becomes more and more a matter of debate by the public press and, in a number of instances, by railway executives, it is a matter of interest to note what has actually been attempted along these lines by our National Legislators. During the past session of Congress the following bills bearing either directly or indirectly on this subject were introduced:

H. R. 79, introduced by Mr. Reilly, of Connecticut, proposes to consolidate the Interstate Commerce Commission with the Post Office under the Postmaster General with ten associates at a salary of $10,000 each. This measure would permit the Department to take over railroads on six months' notice and would guarantee to stockholders a return equal to the average return for the ten years previous. It would allow holders of bonds of such railroads to exchange same for five per cent forty year United States bonds. The measure also specifies regulations for the operation of roads handling freight, parcel post, etc.

Of somewhat similar intent is H. R. 1935, introduced by Mr. Goeke, of Ohio. This bill would extend the operations of the postal service to express companies and railroad carriers; would provide for their acquisition by the government, the value of their holdings, etc., to be determined by the Interstate Commerce Commission.

Mr. Cary, of Wisconsin, introduced H. R. 2866 and 2867. The first deals with the government ownership of telegraph lines, and the second with the government ownership of telephone lines.

STATE COMMISSIONS.

Illinois.—The last regular meeting of the Illinois Railroad & Warehouse Commission was held December 4th. On January 1st the Public Utilities Commission law goes into effect, but the government has thirty days in which to make the appointments of the five members, who will compose the board and the act under which the Illinois Warehouse Commission was inaugurated

Digitized by Google

does not become repealed until the five commissioners are in power.

The Railroad Commission has adopted a code of rules governing the construction, maintenance and operation of interlocking plants. The rules were formulated by the engineers of the Commission and those of Wisconsin, Minnesota and Indiana.

An order has been issued by the Railroad and Warehouse Commission prohibiting the Aurora, Elgin & Chicago Railroad from running its trains at a rate faster than fifty miles an hour. According to the Commission, some of the trains on the road have been operated at a speed of 75 miles per hour.

Maryland.—After several months of investigation of the grade-crossing situation, the Public Service Commission on November 20th, passed an order requiring all railroads in Maryland to file with the Commission within the next fifteen days a statement showing every grade crossing along its line.

When this information is in hand the Commission will make a report to the next Legislature. It is proposed that the remedying of conditions shall proceed conservatively but steadily and in a way that will not work a hardship either upon the public or upon the railroads.

South Carolina.—President W. J. Harrahan, of the Seaboard Air Line Railway, has informed the Railroad Commission that his company has an option on the stock of the North & South Carolina Railway running from Hamlet to Mullins and thence to Andrews, but that it has not exercised it. The Seaboard, he says, has a traffic contract with the North & South Carolina and has aided it in placing securities, but does not own it. A link is now being built from Charleston to Andrews connecting with the North & South Carolina Railway, so that eventually the Seaboard will have a direct entrance to Charleston.

The Seaboard denies ownership of the Georgetown & Western Railway running from Georgetown to Lanes, but admits ownership of the Raleigh & Charleston, running from Lumberton, N. C., to Marion, S. C., and on which the State Railroad Commission has ordered the Seaboard to put continuous mileage.

LEGAL.

New Haven Bond Issue Sustained. — Judge Sheldon, of the Massachusetts Supreme Court, has refused to issue an order restraining the New York, New Haven & Hartford R. R. from issuing the $67,000,000 debenture bonds recently authorized by the Public Service Commission. A restraining order was sought in a bill in equity filed by former Governor Morgan G. Bulkley, of Connecticut. The road filed an answer in the case holding that the Public Service Commission acted within its powers in authorizing the issue and that its decision was not open to review.

False Classification Charges Filed at New York.—A total of 125 cases are now the subject of investigation under Assistant United States District Attorney Knox, at New York City, relative to fraudulent classification of merchandise by shippers. The railroads are said to have lost at the rate of several million dollars annually, by these practices. Three firms against whom indictments were entered have pleaded guilty and fines have been imposed, in the criminal branch of the federal court, aggregating $1,350. Mr. Knox has stated that it is not the aim of the government to prosecute shippers or manufacturers of merchandise, but to protect the railroads by forcing strict observance of the law.

Commerce Court Rules in Favor of Tap Lines.—The United States Commerce Court has annulled the order of the Interstate Commerce Commission which forbids payment by railroads of allowances to so-called tap lines.

The court held that "the Commission was not only without power to forbid any allowance whatsoever to be made by trunk lines to the petitioning proprietary industries for switching but it was also without power to prohibit the making of joint rates by the trunk lines and the petitioning tap lines and the payment by the former to the latter of some division thereof for its services." The court held, however, that the Commission was fully empowered to regulate the amount of allowances so as to prevent rebates and unjust discriminations. The cases will be carried to the Supreme Court.

Supreme Court Construes Hours of Service Law.—In the United States Supreme Court, on November 10th, an important opinion was read by Justice Holmes construing the federal hours of service act regulating the employment of railway employes, in interstate commerce. The opinion affirmed the judgment of the United States District Court for the Eastern District of Texas, against the Missouri, Kansas & Texas Railway, holding that in a violation of the law the railroad may be held for a separate penalty for each employe who is required to work overtime. The railroad sought to set aside the judgment on the ground that while several employes were involved the cases all grow out of a single circumstance and therefore but one penalty could be imposed. The Supreme Court overruled this contention and incidentally rejected another contention put forward by the railroad, that employes not actually at work during the time an engine was disabled and that had gone to another station for repairs, could not be held to be within the act.

TRAFFIC.

Heavy Suburban Passenger Traffic at Boston.—Recent compilations for the year ending June 30, 1913, show that 5,942,104 more persons passed through the South Station at Boston, Mass., than through the Grand Central Station in New York. The totals are: South Station, 28,347,399; Grand Central, 22,405,295—an average daily for the former of 77,664, for the latter, 61,379. The number of trains entering and leaving each week-day at the South Station is 843; the number of trains handled each week-day at the Grand Central is 450. The number of trains handled on Sundays is much less at each terminal.

Passes to Employes' Relatives Cancelled in Pennsylvania.—Owing to provision made in the

Digitized by Google

new Public Service Law of Pennsylvania, the Pennsylvania Railroad has issued the following notice to its employes:

"Under the terms of the Public Service Company Law of the State of Pennsylvania, which becomes effective January 1st, 1914, the free transportation between points within the State of Pennsylvania of members of the families of officers and employes of the above Companies will not thereafter be permissible. The issue of passes covering such transportation after January 1st, next, will be discontinued accordingly."

November Anthracite Shipments.—Total shipments of anthracite coal from Pennsylvania last month were 5,786,931 tons as against 6,165,536 tons in November, 1912, a decrease of 379,605 tons. The amount of coal on hand at tidewater shipping ports remained about the same, being 693,223 tons on October 31st, and 603,031 tons on November 30th.

Total shipments of anthracite coal in the first eleven months of 1913 were 63,407,010 tons. The shipments in December, 1912, were 5,944,502 tons. If the shipments this month equal those of December, last year, the total for the year will be 69,351,512 tons, or 602,787 tons less than the high record of 1911 which was 69,954,299 tons.

Changes in Western Classification Committee.—The proposed radical change in the make-up of the western classification committee, by appointing a permanent committee of three members who will hold daily sessions in Chicago for the presentation of petitions by shippers or carriers and to make recommendation, has been accomplished. The committee consists of H. C. Bush, formerly traffic manager of the Colorado Midland, W. E. Prendergast, general freight agent of the St. Paul, and R. C. Fyfe, chairman of the old committee. The headquarters of the committee will be in the Transportation Building, Chicago.

State Commissions Differ Regarding Express Rates.—At a meeting held in Chicago, on December 12th, of various State Railway Commissioners, there developed a sharp difference of opinion with regard to uniform express rates for the entire country. The Commissioners have been considering the possibility of making intrastate rates uniform with the tariffs recently prescribed by the Interstate Commerce Commission. At the conference referred to, W. A. Ryan, representing the Interstate Commerce Commission was present and explained and defined the National rates. With the submission of figures, however, showing the advantages which some States enjoy through the reductions effected by their Commissions, it became apparent that the uniform rate had encountered opposition that probably will prevent its recommendation by the States' organizations.

The attitude of the State Commissions is of interest, as indicating what might be expected under government ownership.

ELECTIONS AND APPOINTMENTS.

Executive.

DIVIDEND NOTICE.

LEHIGH VALLEY RAILROAD COMPANY.

Philadelphia, December 17, 1913.

The Board of Directors of the Lehigh Valley Railroad Company have this day declared a semi-annual dividend of five per cent (or $2.50 per share) on its preferred stock to stockholders of record, December 27, 1913; and a semi-annual dividend of five per cent (or $2.50 per share) on its common stock to stockholders of record, December 27, 1913; both payable January 10, 1914.

Checks will be mailed.

J. M. BAXTER, Treasurer.

A Practical, Accurate

Atlas of Traffic Maps

For the Railroad Traffic Man

The New Atlas of Traffic Maps is just off the press. It is a great convenience for the practical man and a necessity for the inexperienced traffic man. It brings together under its covers information that heretofore has been scattered through dozens of directories, circulars and reports.

These Maps are eminently practical—they were prepared by traffic authorities and checked by experts in the various freight associations. They are indexed for ready reference, and each map supplements the other. They give accurate and comprehensive information concerning freight rate territories throughout the country.

The Atlas pictures graphically by means of colored maps the freight rate territories of America. It is one of a series of publications forming the basic material for our new course of instruction by correspondence in Interstate Commerce and Railway Traffic.
